Executive Summary

The Electricity Supply Board is progressing the Green Atlantic at Moneypoint Concept to transform the existing Moneypoint site in County Clare from a coal-fired power station into a renewable energy hub and a strategic resource for the offshore renewable energy sector. The concept includes phased projects such as grid services, offshore wind support facilities, lower and zero carbon generation, and alternative fuel infrastructure like hydrogen and ammonia. The site covers approximately 180 hectares of land and 65 hectares of foreshore on the northern shore of the Shannon Estuary, with development guided by nine land-use zones and 44 principles to ensure environmental protection and alignment with national policy.

In accordance with Article 6(3) of the Habitats Directive, the GA Concept was subject to Screening for Appropriate Assessment and a Natura Impact Statement. The assessment identified a credible risk of likely significant effects on European sites, particularly due to the proximity and overlap of the project area with the Lower River Shannon Special Area of Conservation and the River Shannon and River Fergus Estuaries Special Protection Area. As a result, the plan proceeded to Stage 2 Appropriate Assessment (Natura Impact Statement).

The report found that the Green Atlantic at Moneypoint Concept could result in likely significant effects on protected sites. These include the risk of direct and indirect habitat loss, accidental pollution events, disturbance from construction and operation (including noise and vibration), and the potential spread of invasive species. The main features at risk are the habitats and species for which the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA are designated, such as estuaries, reefs, otter, bottlenose dolphin, lamprey, salmon, and wetland and waterbird species. The assessment also considered the possibility of effects on more distant sites through large-scale pollution events or underwater noise.

A comprehensive set of mitigation measures is built into the Green Atlantic at Moneypoint Concept and further recommended in the report. The Concept is a high-level strategic plan and does not contain the detailed design information that would typically be available at project level. As such, it is not appropriate to specify detailed mitigation measures at this stage. Instead, it is recommended that each individual project arising from the Concept is subject to Screening for Appropriate Assessment and, where necessary, a Natura Impact Statement. Appropriate mitigation measures should then be identified and applied at the project stage, based on the specific details and potential impacts of each development.

All development proposals must demonstrate that they will not negatively affect the conservation objectives of the nearby protected sites. It is recommended that all project level developments will be subject to detailed environmental assessment, including Appropriate Assessment, with avoidance and minimisation of impacts as a priority. Timing restrictions will be applied to avoid sensitive periods for key species. Best practice will be followed for pollution prevention, oil spill contingency, and invasive species management. Specific measures for underwater noise will be implemented, including adherence to national guidance and noise and vibration assessments. There will be ongoing engagement with statutory bodies at project level. If any future project within the Coastal Infrastructure Zone results in permanent loss of protected habitats, further assessment will be required, including demonstration of alternatives, reasons of overriding public interest, and provision of compensatory habitat.

The Natura Impact Statement concluded that, with the recommended mitigation measures in place, the Green Atlantic at Moneypoint Concept can be delivered without adverse effects on the integrity of the Lower River Shannon Special Area of Conservation and the River Shannon and River Fergus Estuaries Special Protection Area, either alone or in combination with other plans or projects. However, any future development within the Coastal Infrastructure Zone that results in permanent loss of protected habitats will require further assessment and compensatory measures. The report provides a robust framework for ongoing assessment and management to ensure compliance with European and national legislation and the protection of these important sites.

1. Introduction

1.1 Overview

The Electricity Supply Board (ESB) is currently preparing the Green Atlantic (GA) @ Moneypoint Concept 2025 (hereafter referred to as the ‘GA Concept’). Arup has been appointed by the ESB to prepare a Screening for Appropriate Assessment (AA) and Natura Impact Statement of the GA Concept.

Article 6(3) of the Habitats Directive requires that any plan or project¹, which is not directly connected with, or necessary to the management of a European site, but would be likely to have a significant effect, either alone or in-combination with other plans or projects, should be subject to an AA.

The GA Concept, which covers the current site owned and operated at Moneypoint by the ESB, is subject to such an assessment. This means that the GA Concept can only be approved once it has been determined, following an assessment that it will not result in the potential for likely significant effects and consequently not adversely affect the integrity of a European site.

1.2 Report Aim

This combined AA Screening and Natura Impact Statement has been prepared to provide information for the ‘competent authority’² regarding the potential for ‘Likely Significant Effects’ (LSE) of the elements of the GA Concept on European sites within the Zone of Influence (ZoI) of the GA Concept elements.

The Natura Impact Statement section of the report provides information for the competent authority regarding the potential for adverse effects on the integrity of European sites, resulting from the implementation of the GA Concept.

1.3 Basis for Appropriate Assessment

The Habitats Directive on the conservation of natural habitats and wild fauna and flora (92/43/EEC) (the ‘Habitats Directive’ provides the legal protection for habitats and species, with Articles 3 to 9 providing legislation protection to the EU wide network of sites known as the Natura 2000 site network. Natura 2000 is a network of protected sites which comprises Special Areas of Conservation (SACs) and Special Protection Areas (SPAs) (referred to as European sites within this report). The definitions of both SACs and SPAs are provided in Section 3.2.1.

Articles 6(3) and 6(4) of the Habitats Directive set out the decision-making tests for plans and projects likely to affect European sites. Article 6(3) establishes the requirement for AA whilst Article 6(4) sets out the Alternative Solutions, Imperative Reasons of Overriding Public Interest (IROPI) and compensatory measures where Adverse Effects on the Integrity (AEoI) on European sites cannot be excluded.

The Habitats Directive has been transposed in Ireland by the European Communities (Birds and Natural Habitats) Regulations 2011 (S.I. No. 477 of 2011) (as amended), and by Part XAB of the Planning and Development Act, 2000 (as amended). In the context of the GA Concept, due to its nature as a land-use plan, the governing legislation is principally the Planning and Development Act, 2000 (as amended).

Under the Planning & Development Act, prior to submitting for approval a plan that is not directly connected with or necessary to the management of either a SPA or SAC, competent authorities are required to consider whether the plan may have a significant effect on such a site; and where this is the case, that an AA of the implications of the GA Concept must be carried out.

¹ Note: Any further reference made to ‘plans or projects’ in this report includes Strategies.

² Per the Planning & Development Act 2000 (as amended) the competent authority is defined as “A competent authority, in performing the functions conferred on it by or under this Part, shall take appropriate steps to avoid in a European site the deterioration of natural habitats and the habitats of species as well as the disturbance of the species for which the site has been designated, insofar as such disturbance could be significant in relation to the objectives of the Habitats Directive”

1.4 Public Consultation

The draft AA Screening and Natura Impact Statement was published alongside the GA Concept for statutory public consultation in June 2025 for a period of six weeks. Following this six week period, text changes were made to the GA Concept consisting of minor amendments to the body of text in recognition of the submissions made. No changes were made to the principles or objectives of the GA Concept.

1.5 Statement of Competency

The statements of competency adjoin this report in Appendix C.

1.6 Layout of Report

This report is structured as follows:

- Section 2 provides an overview of the Green Atlantic @ Moneypoint Concept
- Section 3 outlines the AA process, and provides important definitions
- Section 4 outlines the guidance, data and methodology used to inform the assessment
- Section 5 provides the impact prediction, focussed on the Source-Pathway-Receptor methodology
- Section 6 provides an Assessment of Effects including an in-combination assessment
- Section 7 provides the Mitigation; and
- Section 8 provides the summary and conclusion.

2. Green Atlantic @ Moneypoint Concept

2.1 Overview

The ESB is a corporate body, established in 1927 to control and develop Ireland's electricity network and was established in accordance with the Electricity Supply Board Act 1927. The ESB site at Moneypoint, County Clare was developed in the 1970s and operates as a 900 Megawatt (MW) coal-fired generating station. Additionally, the site produces electricity from a 17.25MW windfarm on site and from thermal generation.

The GA Concept sets forward the concept for transforming the Moneypoint site into a renewable energy hub and a strategic resource for the Offshore Renewable Energy (ORE) sector. A series of strategic objectives and land use zonings with principles guiding their development are contained within the GA Concept. A number of projects, to be delivered under a phased transition are set forward within the GA Concept including the development of grid services, the construction and operation of a facility to support development of offshore windfarms and the development of lower and zero carbon generation capability and alternative fuel facilities.

Future phased delivery will be by means of a series of individual planning and environmental consents and acknowledged as such within the GA Concept. Where the plans and intentions for the site change, ESB may update its site strategy as required. All development proposals on the Moneypoint site, arising from the GA Concept, will need to be evaluated at project level stage to consider combined risks and potential consequences to the environment, as required by the associated relevant planning and environmental consents in addition to the European Communities (Birds and Natural Habitats) Regulations 2011 (as amended).

2.2 Transition to Lower Carbon Generation

As set out below, one of the principal objectives of the GA Concept (Objective 2) is the transitioning of the site from a high-carbon coal-fired power generating facility to a lower carbon generating facility. To this end, ESB investigated alternative fuelling options including the use of Heavy Fuel Oil (HFO), to enable Moneypoint to operate as an on-demand facility. Having determined the HFO option best supports reduced running at the Station, in May 2023 ESB formally started the process of seeking permission for the conversion of the Station from coal to HFO. The application for this conversion was lodged with An Bord Pleanála in February 2024 and subsequently granted in September 2024 (Case 319080).

This proposal provides a firm date for the cessation of coal fired generation at the site (2025) and will see it switch to an on-demand lower carbon operating profile, operating until late 2029 under a 'generator of last resort' agreement. This will ensure Moneypoint supports security of supply for Ireland, pending the development of new low and zero carbon dispatchable generation and large-scale renewables and as such represents an interim measure.

For the purposes of the below documented Screening for AA and AA processes, the consented capital works for the conversion of the site from a coal-fired facility to an HFO-fired facility is not considered as forming part of the GA Concept, given its prior approval. This project has been assessed, as documented within the application documents inclusive of an Environmental Impact Assessment Report (EIAR) and Natura Impact Statement (Mott MacDonald 2024³). Likely significant effects upon Natura 2000 sites associated with this project and identified within the associated Natura Impact Statement (NIS) in addition to conditioned mitigation measures, have been included for consideration in-combination with the GA Concept at Section 4.7.

It is noted however that the ongoing use of HFO for electricity generation at the Moneypoint site forms a part of the GA Concept, as part of a broader transition to lower carbon energy, and as such, and in order to demonstrate a comprehensive approach to assessment, the aspects relating to the ongoing use of HFO including delivery of the material to the site are assessed within this document.

³ AA Screening and NIR - Moneypoint Security of Supply.pdf (pleanala.ie)

2.3 GA Concept Objectives

Four strategic objectives are contained within the GA Concept:

- Objective 1 - To ensure Moneypoint continues to support economic development and activity in the Shannon Estuary, County Clare, the broader Region and State by providing a reliable source of electricity while ensuring the site is developed and operated to the highest environmental standards, in-line with ESB's Environmental Management Systems
- Objective 2 - To transition the site to a new, lower carbon operating profile, moving progressively towards zero carbon generation with Moneypoint providing dispatchable electricity and energy storage to support an increasingly renewable energy sector
- Objective 3 - To develop Moneypoint as a base for the offshore renewable energy (ORE) sector, acting as a construction and deployment base, and a manufacturing location for zero carbon fuels; and
- Objective 4 - To develop and operate Moneypoint so it supports Ireland's ambitions to become a net exporter of zero carbon energy.

Further to the objectives, there are 44 'principles guiding development' which are associated with 9 land-use zones within the Moneypoint site. The 9 land-use zones are listed below and displayed in Figure 1:

- Coastal Infrastructure Zone
- Marine Energy Zone
- Industrial Energy Zone
- Transmission Asset Zone
- General Development Zone
- Buffer Zone
- Ash Management Zone
- Screening Zone; and
- Woodland Zone.

The principles are associated with potential future projects that aim to transition the Moneypoint site from its current use to a renewable energy hub and resource for the ORE sector. Land-use changes, management actions, alignment with values such as the circular economy, adherence with national legislation and operational activities are outlined within these principles.

The GA Concept objectives and the principles shall be assessed for the potential for LSE as part of this AA Screening and where likely significant effects are identified, these shall be assessed within the Natura Impact Statement. Where adverse effects on a European site are identified, these shall be assessed, and mitigation shall be recommended, as relevant.

2.3.1 Constraints Analysis

Section 4 of the GA Concept contains a constraints analysis pertaining to the future project proposals that align with the 9 land use zones. A high-level analysis regarding planning and land use; landscape and setting; biodiversity and ecology; land and water; and cultural heritage has been provided. Characteristics of future development and their scenarios are outlined and in regard to biodiversity and ecology, the GA Concept accounts for proximity to European sites and the potential pathways that exist between the land-use zones and European sites. The GA Concept also provides text pertaining the development potential of each of the land-use zones, identifying in-design mitigation⁴ in regard to the constraints analysis. That in-design mitigation is provided for each respective land use zone below in Table 1.

⁴ The GA Concept included these measures proposed by the ESB, prior to the Screening for AA and AA process.

Table 1 In-design mitigation identified within the GA Concept for constraints within land-use zones.

Land Use Zone	Mitigation Constraints identified within the GA Concept	Reference location within GA Concept
Ash Management Zone (AMZ)	<p>Where ash remains in situ, any works must demonstrably not impact on the integrity of the capped cells. Development requiring minimal groundworks may be acceptable – but only where that risk can be shown to be avoided or mitigated. Any such development proposal would require a detailed Hydrogeological Risk Assessment and design and method statement which would need to be submitted to the EPA for approval in order to proceed with further planning. It would be challenging to provide a definitive assessment that shows that the integrity of the ASA cap will not be impacted as monitoring (water levels, material permeability, drainage flow, compaction) could only occur during and after the piling/construction phase, whereas the EPA and Planning Authorities would require certainty of impacts in advance.</p> <p>Where, as part of the broader remediation strategy removal of ash for reuse in the circular economy is feasible, additional development potential could be realised. Such works would be carried out in-line with Waste Management Regulations. Where ash is removed, additional fill material will likely be needed to level the affected areas. All such proposals would require full environmental assessment – particularly to ensure that any potential groundwater or surface water pathways are identified so impacts and effects on the estuarine habitats could be understood; and be carried out in accordance with any consent and licence issued</p>	AMZ1 – AMZ9 Page 22-23
Marine Energy Zone (MEZ)	<p>Given the potential for development of additional port infrastructure along the coastline, visual and ecological impacts will need to be carefully managed – particularly given the designated status of the coastline.</p> <p>The lands immediately adjoin the Shannon Estuary shoreline along the southern boundary of the site. The estuary and shoreline habitat forms part of designated European Sites - the Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA (site code 004077). Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives for these sites. It is noted that the local sensitivity of the site, including the presence of bats in the vicinity, may require the adoption of appropriate mitigation measures.</p> <p>The development potential is significant on the assumption that:</p> <ul style="list-style-type: none"> • ESB intends not to develop the FGD landfill Area B at this location; and • ESB may consider relocation of the existing wind turbines and met mast, in order to significantly enhance the contribution of this plot to the redevelopment of Moneypoint. 	MEZ1 – MEZ9 Page 19-20
	<p>The FGD landfill Area A is expected to reach capacity in late 2024. At this point it will be capped and reinstated in line with the DMP and CRAMP. As part of a broader remediation strategy, the potential for the removal of the material in the FGD is being explored by ESB. Where this is feasible additional development potential of this site could be realised. The lands towards the coast are of higher sensitivity for ecological and visual reasons. Any infrastructure that interacts with the estuary e.g. the jetty, will be subject of appropriate environmental assessment to determine any impacts that may arise.</p>	MEZ1 – MEZ9 Page 19-20
	<p>Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives for the designated sites along the coast including the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA. Similarly – notwithstanding its designation as a working landscape, visual impact of any development on the coastline will be a consideration.</p>	MEZ1 – MEZ9 Page 19-20
Coastal Infrastructure Zone (CIZ)	<p>Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives for the designated sites along the coast including the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA. Similarly – notwithstanding its designation as a working</p>	CIZ1 – CIZ8 Page 20-21

Land Use Zone	Mitigation Constraints identified within the GA Concept	Reference location within GA Concept
	landscape, visual impact of any development on the coastline will be a consideration.	
Industrial Energy Zone (IEZ)	This site interacts with the Shannon Estuary shoreline along the southern boundary of the site. The estuary and shoreline habitat forms part of designated European Sites - the Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA (site code 004077). Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives for these sites.	IEZ1 – IEZ7 Page 21-22
General Development Zone (GDZ)	All such proposals would require full environmental assessment – particularly to ensure that any potential groundwater or surface water pathways are identified so impacts and effects on the estuarine habitats could be understood; and be carried out in accordance with any consent and licence issued	GDZ1 – GDZ3 Page 24
Buffer Zone (BZ)	All such proposals would require full environmental assessment – particularly to ensure that any potential groundwater or surface water pathways are identified so impacts and effects on the estuarine habitats could be understood; and be carried out in accordance with any consent and licence issued	BZ1-BZ4 Page 24-25
Transmission Asset Zone (TAZ)	Protected woodlands will not be affected by new development. It is noted that the level of the ground falls away from the N67, with existing vegetation screening the site from the public road. There will be limited scope for new development in this area where it can be demonstrated that it will not impact negatively on the ecological value of the woodlands, or the visual integrity of the boundary planting. The networks assets – substations, will remain in situ. It is understood that the route of underground cables across this site will need to be maintained free from development. Similarly, development under existing overhead lines will be affected by the need to maintain safe clearance zones. It is likely that new energy generation projects (developed by both ESB and third parties) will give rise to a requirement for new underground services e.g. electrical cables, gas pipes, etc. across the site.	TAZ1 -TAZ2 Page 25
Screening Zone (SZ)	Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives for the designated sites along the coast. Similarly – notwithstanding its designation as a working landscape, visual impact of any development on the coastline will be a consideration	SZ1 – SZ2 Page 25
The Woodland Zone (WZ)	Protected woodlands will not be affected by new development. It is noted that the level of the ground falls away from the N67, with existing vegetation screening the site from the public road. There will be limited scope for new development in this area where it can be demonstrated that it will not impact negatively on the ecological value of the woodlands, or the visual integrity of the boundary planting. The networks assets – substations, will remain in situ. It is understood that the route of underground cables across this site will need to be maintained free from development. Similarly, development under existing overhead lines will be affected by the need to maintain safe clearance zones.	WZ1 – WZ2 Page 25

2.4 Timeframe

The ESB has prepared the GA Concept to cover the next ten to fifteen year period. The likely landmark phases of development are:

- **From 2024 to early 2030s** – initiation of site remediation and phased development of energy storage and additional dispatchable low carbon generation infrastructure at Moneypoint;

- **2025** – cessation of coal fuelled generation with the conversion of Moneypoint Generating Station site to a lower carbon generating facility;
- **From late 2020s** – continued site remediation and initiation of port upgrade works; establishment of Moneypoint Hub as a construction and operations base for the ORE sector; and
- **Post 2035** – ESB ORE projects on the west coast become operational; Moneypoint transitions over time to alternative low and zero carbon fuels, such as green hydrogen and ammonia.

It is anticipated that the GA Concept will be subject to periodic reviews, particularly in the context of any significant changes to ESB Strategy; changes in the receiving environment as may arise from new developments; or changes to land-use policies as may arise from a review of the Clare County Development Plan (CDP) or other spatial strategies. The timeframe for delivery for the GA Concept is to 2050 with the transition to be phased and delivered through a number of projects.

2.5 Geographic Area

The Moneypoint site is located on the northern shore of the Shannon Estuary in Co. Clare, approximately 3km west of Killimer and 6 km south-east of Kiltrush. The extent of the ESB's current landholding in the area comprises 180 Hectares (Ha) of onshore landbank and 65.24 Ha of foreshore area.

The GA Concept area and associated zones is illustrated in below in in Figure 1.

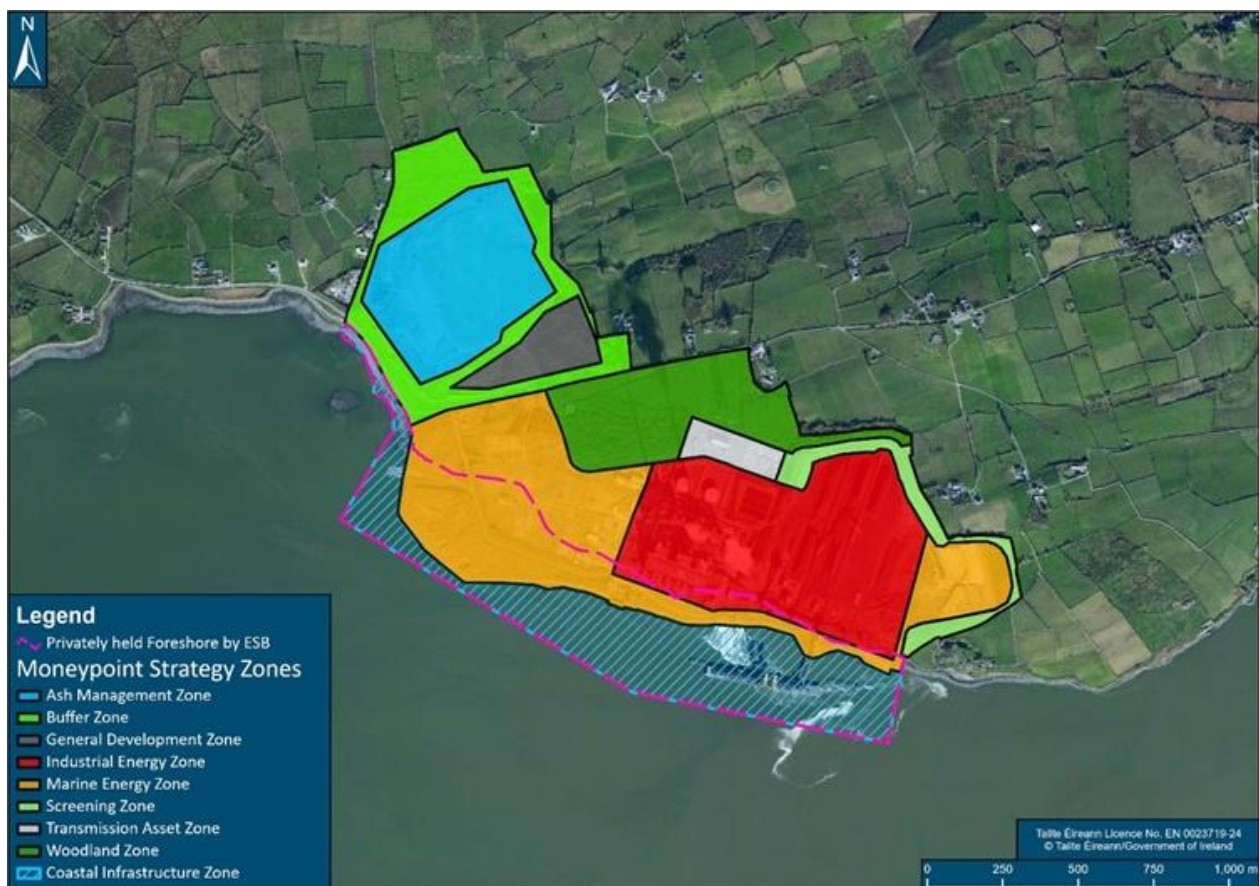

Figure 1 The Green Atlantic @ Moneypoint Concept Area

2.6 Elements of the Green Atlantic @ Moneypoint Concept

2.6.1 Moneypoint Synchronous Compensator

ESB has recently completed the development of a Synchronous Compensator - a key grid support, on the Moneypoint site. This is an electrical device that is used to manage the stability of the national grid. Though a Synchronous Compensator does not generate electricity, it is essentially a large electric motor that is connected in a particular manner to allow it to act as a support to the system when required.

With an electrical rating of 400 MVA, this is currently the largest such operational facility in the world.

2.6.2 Land Remediation

As an industrial landbank, the transformation of Moneypoint will require the remediation of brownfield lands – including the coal storage area, the FGD landfill area and the ASA. Existing large-scale coal handling infrastructure will also be removed from the site, on a phased basis.

It is anticipated that these development works will be actioned at an enabling stage for larger redevelopment projects i.e. in preparing a specific site for future development. As such they will be phased, with consents and associated environmental assessment undertaken in the context of consenting new development as set out in the Concept.

2.6.3 Long Duration Energy Storage

The development of adequate long- and short-term energy storage is essential to supporting an energy system that is increasingly reliant on renewable energy generators, which are, by their very nature, intermittent in nature.

ESB continues to identify suitable sites for the siting of energy storage systems – and it is anticipated that energy storage will be accommodated within the Moneypoint site, subject to the availability of a suitable grid connection. Storage will be an ancillary land-use, relative to the primary functions of the site – namely energy generation and infrastructure to support ORE developments.

2.6.4 Future Thermal Generation and Alternative Fuels

Moneypoint will continue to act as a dispatchable thermal generation site ensuring energy security for the State in the context of an increasingly renewable energy system.

ESB continues to carry out feasibility studies to determine the fuel, operating parameters and scale of any new thermal generation that may be developed at the site; and it is currently envisaged that, in-line with prevailing energy policies and national and EU level, the next generation facility at the site facilitate will be capable of converting to low and zero carbon fuels as technology develops. The physical characteristics of a new thermal facility will be similar to the existing generating station i.e. a large-scale industrial facility characterised by a tall stack, ancillary plant and equipment etc.

While it is currently unknown what potential fuel or technology will be utilised, subject to the availability of surplus renewable energy from offshore generators and the emergence of suitable technologies, ESB plans to develop a zero carbon fuels production, storage and dispatchable generation facility at Moneypoint from the middle of the next decade and in line with the availability of surplus ORE. Likely this facility will utilise green hydrogen – producing a clean, zero-carbon fuel, from renewable energy and using it for power generation, heavy goods vehicles in the transport sector and to support decarbonisation of a wide range of industries such as pharmaceuticals, electronics and cement manufacturing. This facility will potentially enable the export of hydrogen fuel for use overseas, retention of the fuel in Ireland for domestic use, and ancillary distribution such as ship refuelling.

This future development may include the development of an ammonia production plant to support additional low carbon / carbon neutral thermal generation. Powered by curtailed renewable electricity from either ORE or onshore sources, a production facility will produce the ammonia. This would be stored on-site and utilised, as needed, to power a gas fired thermal facility (likely a combined cycle gas turbine) which would be available to support the grid as a dispatchable source of electricity. Any surplus ammonia could be exported from the site to industrial hubs or for agricultural use. All such projects will be subject of full environmental assessment as part of any new consenting and licensing process.

2.6.5 The Moneypoint Hub Project

ORE development along the West coast will present a significant opportunity and requirement for the development of regional support facilities – including an ORE hub. Such a development will need a local deep-water port to act as a staging point for turbine deployment. The need for this type of facility is reflected in a 2020 Carbon Trust report on the potential for investment and employment in Ireland's offshore wind industry, which recommends that the Irish Government should consider a strategic investment in a port on

the west coast. As envisaged in the National Hydrogen Strategy, such a facility also has the potential to facilitate production of green fuels to decarbonise other industrial sectors.

The Shannon Estuary is emerging as being key to meeting the ORE sector's requirements, given the deep water channels and proximity to development sites. Given Moneypoint was originally developed at this location to take advantage of the natural deep waters of the Estuary, ESB now proposes to utilise this natural advantage to develop the Moneypoint Hub Project and deliver a facility for the deployment of ORE infrastructure.

The location of the site is significant to ORE developers, reducing complexity of transporting parts - which can often be complicated by weather windows in addition to facilitating reduced transportation times and minimise delays and downtime.

In line with the national plan-led approach, it is envisaged that the south and west coasts of Ireland will be the focus for the deployment of at-scale offshore renewable energy projects from the late 2020's. It is therefore envisaged that Moneypoint will be developed to serve both the fixed and floating turbine industries. It will act as a dedicated land and marine facility for staging, fabrication and deployment of offshore wind foundations. It will comprise three key activity zones:

- **Turbine Laydown:** A dedicated area primarily used for the storage of Wind Turbine Generator (WTG) elements (blades, nacelle, tower, mooring lines / anchors etc).
- **Construction Yard:** An area of hardstanding used for the landside fabrication, assembly and storage of floating platforms and fixed foundation elements.
- **Quayside Infrastructure:** dedicated infrastructure will be provided to ensure access to deepwater to serve the floating offshore wind industry and allow safe passage for all vessels and units likely to operate at the facility.

The Hub will act as a construction site for the fabrication/assembly/storage of the foundations. It will further act as a staging point for the mating of wind turbines onto floating foundations, facilitating the storage of these elements, prior to their tow-out to offshore wind farm sites.

The existing jetty facilities were developed for the transport and handling of coal and oil. The requirements for this industry are significantly different than existing port facilities at Moneypoint can accommodate. It is known that new quay infrastructure will be required for the delivery of WTG elements, deployment of WTG substructures and mating of WTG to the floating offshore wind substructure at the quayside. As foundation substructures become ready for WTG mating, they will be moored along the quay wall and heavy lift location ready for receipt of the WTG components. Facilities to accommodate this will be developed.

ESB is currently undertaking studies and assessments to look at options and alternatives for the location, layout and orientation of any new structure(s) proposed to cater for the construction and deployment of these structures; the requirements of operational vessels and the characteristics of the receiving environment. A wide range of alternative design approaches are under consideration – ranging from upgrade of the existing jetty, to dredging, land reclamation and the construction of a new, purpose-built port facility; having regard to the ecological sensitivity of the Shannon Estuary.

It is anticipated that limited wet storage of units would be facilitated close to the port, but that the Moneypoint site will not accommodate a dedicated wet storage facility.

The site will also facilitate operations and maintenance (O&M) capacity and host depots for the servicing and maintenance of offshore windfarms. The port provides a sheltered, deep-water area for turbines to be towed back to for major repair works – something that is vital for the maintenance of floating turbines. The availability of the Hub will provide cost savings for individual developers, facilitating faster response times from a permanent base close to the coast. The advantage of having readily accessible O&M facilities, will make a contribution to reduce energy costs, to the benefit of both operators and the consumer.

2.6.6 Offshore Renewable Projects

ESB and a joint venture partner propose to develop offshore wind projects off the coasts of Counties Clare and Kerry subject to the identification of Designated Maritime Area Plans by central government and the award of Maritime Area Consents for offshore wind development within these areas. It is envisaged that the

projects will utilise floating foundation turbines and will initially be developed at less than 500MW scale but later projects will increase to GW scale. It is envisaged that the first projects will be in production post 2035.

It is anticipated that the export cables for these projects, connecting the offshore substation and the electricity grid, will come onshore and then be routed underground to a new onshore substation located at, or close to, the Moneypoint station site. Where feasible this will be a hybrid connection, thereby maximising efficient use of the grid. The onshore substation will in turn be connected to the Eirgrid operated 400 kV transmission substation at Moneypoint or may utilise a private wire to supply a non-grid off-taker. The onshore substation may be located within the Moneypoint lands and will include a host of equipment including compensation equipment, transformers and switchgear.

2.7 Development and Activity Zones: Principles Guiding Development

The above elements of the GA Concept will be delivered in respect of the Activity Zones identified for the site, as discussed above. Each of these Activity Zones is set out with an accompanying set of ‘Principles Guiding Development’ within the GA Concept. A summary for each zone is provided below however consideration of each of the principles ascribed to each zone is discussed further with respect to their potential to give rise to likely significant effects, at Section 4.6.

- **Marine Energy Zone** - It is proposed that the Marine Energy Zone will be developed to facilitate onshore development associated with marine-related industries, the Moneypoint Hub Project and ORE developments in the wider maritime area.
- **Coastal Infrastructure Zone** – It is proposed that the Coastal Infrastructure Zone will be managed and developed to maintain operations at the existing generating station and facilitate offshore development associated with the Moneypoint Hub Project.
- **Industrial Energy Zone** – It is proposed that the Industrial Energy Zone will be developed to facilitate continued large scale electricity generation.
- **Ash Management Zone** – It is proposed that the Ash Management Zone will be developed having regard to the sensitivities of the area.
- **General Development Zone** – It is proposed that the General Development Zone will accommodate general development, of a relatively small scale.
- **Buffer Zone** – It is proposed that the Buffer Zone shall accommodate small-scale, low-level development to manage the transition between industrial and greenfield lands.
- **Transmission Asset Zone** – It is proposed that the Transmission Asset Zone will be maintained and developed to protect and enhance electricity transmission assets.
- **Screening Zone** – It is proposed that the Screening Zone will be maintained and developed to protect underground services and provide visual screening.
- **Woodland Zone** – It is proposed that the woodland zone will protect existing woodland and to provide a visual buffer between the site and the N67.

2.8 Legislation and Policy

The operation of the Moneypoint lands as an electricity generation station is regulated by legislative instruments and is dependent on consents and licences issued by the EPA. The legislative instruments are listed below:

- Electricity (Supply) Acts (1927-2004) (as amended)
- The Electricity Regulation Act 1999 (revised)
- The Electricity and Gas Regulation Acts (As amended)
- The Environmental Protection Agency Act 1992 (as amended)

- The Environmental Protection Agency (Emergency Electricity Generation)(Amendment) Act 2023 SI 136/2023
- The Planning and Development and Foreshore Act 2022 (as amended)
- The Waste Management (Certification of Historic, Unlicensed Water Disposal and Recovery Activity) Regulations 2008 (SJ. No 524 of 2008)
- The Control of Major Accident Hazard Regulations (COMAH) Regulations, 2015.

The consents and licences required at Moneypoint are as follows:

- Industrial Emissions (IE) licence issued by the EPA under the Environmental Protection Agency Act (as amended) which places strict conditions on how an activity must operate so as to protect the environment from pollution that might otherwise arise. The IE licence authorises for the combustion of fuels and the use and management of landfills for waste management and includes a Decommissioning Management Plan (DMP) and Closure, Restoration and Aftercare Management Plan (CRAMP) for the disposal and storage areas
- Greenhouse gas emissions permit under Annex 1 of the Directive 2003/87/EC.

3. Methodology, Guidance and Data Sources

3.1 Appropriate Assessment Stages

The AA process involves a number of steps and tests that need to be applied in sequential order.

An important aspect of the process is that the outcome at each successive stage determines whether a further stage in the process is required. First of all, a plan or project must be screened to identify whether the potential for likely significant effects on a European site(s) exists. If that possibility cannot be excluded, an AA is to be undertaken prior to any consent being granted. Consent shall not be granted if it cannot be concluded that there will be no adverse effects on the integrity of European sites. Article 6(4) allows for consent to be granted in particular and exceptional circumstances, even if adverse effects may arise.

The AA Screening (and where applicable, Natura Impact Statement) must include a final determination by the competent authority as to whether or not a proposed plan or project would adversely affect the integrity of a European site. In order to reach a final determination, the competent authority must undertake examination, analysis and evaluation, followed by findings, conclusions and a final determination.

3.2 Definitions

3.2.1 European Sites

European sites, as defined under the European Communities (Birds and Natural Habitats) Regulations 2011 (S.I. 477/2011)(as amended) are part of the Natura 2000 network and include those designated as SACs, candidate SACs (cSACs), SPAs or proposed SPAs (pSPAs).

SACs are selected for the conservation of Annex I habitats⁵ (including priority types which are in danger of disappearance) and Annex II species⁶ (other than birds) as defined by the respective annexes of the Habitats Directive.

SPAs are selected for the conservation of Annex I birds and all migratory birds and their habitats as defined by the respective annexes of the Birds Directive.

The Annex habitats and species, for which each site is selected, are termed the Qualifying Interests (QI) for SACs and termed Special Conservation Interests (SCI) for SPAs.

3.2.2 Conservation Objective

Conservation Objectives (COs) for European sites are defined for the relevant QIs and SCIs. In its most general sense, a CO is the specification of the overall target for the species and/or habitat types for which a site is designated in order for it to contribute to maintaining or reaching favourable conservation status⁷.

3.2.3 Source-Pathway-Receptor Model

The Source-Pathway-Receptor (SPR) model is used to assess where a potential effect may result by examining the source, its pathway and the receptor. As per guidance from the OPR⁸ these can be defined as follows:

- **Source:** The origin of a potential effect which may include characteristics of a plan or project that have the potential to result in effects e.g. direct impacts such as loss of habitat

⁵ Annex I habitats are habitats whose conservation requires the designation of Special Areas of Conservation

⁶ Annex II species are animal and plant species whose conservation requires the designation of Special Areas of Conservation

⁷ Commission Note on Setting Conservation Objectives for Natura 2000 Sites (November 2012) European Commission, Doc. Hab.12-04/06. Accessed at: http://ec.europa.eu/environment/nature/natura2000/management/docs/commission_note/commission_note2_EN.pdf

⁸ OPR (2021) Appropriate Assessment Screening for Development Management. OPR Practice Note PN01. Accessed at <https://www.opr.ie/wp-content/uploads/2021/03/9729-Office-of-the-Planning-Regulator-Appropriate-Assessment-Screening-booklet-15.pdf> November 2023.

- **Pathway:** How the potential effect may occur on the source. These are identifiable through linkages that may occur through the plan or project and European sites e.g. direct pathways such as physical proximity, hydrological connections or indirect pathways such as disturbance to migrating species; and
- **Receptor:** The European site network and respective QIs/SCIs, their ecological condition and sensitivities e.g. freshwater pearl mussel is sensitive to siltation in water.

3.2.4 Zone of Influence

A Zone of Influence (ZoI) within any assessment of projects and/or plans considers the area over which ecological features may be affected by biophysical changes as a result of the proposed plan/project and associated activities.

3.3 Relevant Guidance

The following guidance was used in carrying out the Assessment:

- Appropriate Assessment of Plans and Projects in Ireland – Guidance for Planning Authorities (Department of Environment, Heritage and Local Government, 2010 revision)
- Appropriate Assessment under Article 6 of the Habitats Directive; Guidance for Planning Authorities. Circular National Parks and Wildlife Service (NPWS) 1/10 and PSSP 2/10
- Assessment of plans and projects in relation to Natura 2000 Sites: Methodical guidance on Article 6(3) and (4) of the Habitats Directive 92/43/EEC (European Commission Environment Directorate-General, 2021)
- Communication from the Commission on the precautionary principle. European Commission (2000)
- Guidance Document on Article 6(4) of the Habitats Directive 92/43/EEC (European Commission, 2007)
- Guidelines for Good Practice Appropriate Assessment of Plans under Article 6(3) Habitats Directive (International Workshop on Assessment of Plans under the Habitats Directive, 2011)
- Managing Natura 2000 Sites: The Provision of Article 6 of the Habitats Directive 92/43/EEC (EC Environment Directorate-General, 2019); and
- Office of the Planning Regulator Practice Note PN01 - Appropriate Assessment Screening for Development Management (OPR, 2021).

The requirements for Screening for AA, and NIS, for European sites, are set out in Regulation 42 of the European Communities (Birds and Natural Habitats) Regulations, 2011 (S.I. 477 of 2011) with numerous relevant rulings and opinions issues in both Irish and EU courts. AA is a process required under Article 6(3) of the EU Habitats Directive as transposed by the aforementioned Regulations and the Planning and Development Act 2000 (as amended).

3.5 Methodology

In line with the relevant guidance and case law, the AA consists of the following steps, which are iterative in nature:

1. **Impact Prediction:** Identify the aspects of the GA Concept likely to affect the COs of European Sites. The more general classification of impacts can include direct and indirect effects; short and long-term effects; construction, operational and decommissioning effects; and isolated, interactive and cumulative effects. A SPR model has been used to identify the zone of influence
2. **Assessment of Effects:** The potential impacts of the GA Concept are assessed as to whether they are likely to result in adverse effects on the integrity of European sites. This requires understanding of relevant QIs/SCIs and associated COs; and

3. **Mitigation Measures:** Mitigation measures are identified to avoid or reduce any adverse effects on the integrity of any European site. Pre-existing embedded mitigation measures pertaining to any aspect of the GA Concept process, including the planning process where safeguards are already in place in existing legislation and policy, or within the GA Concept. Any additional, outstanding mitigation that is still required is also considered.

3.5.1 Impact Prediction: Identifying the Zone of Influence

The ZoI is established using the SPR method and takes into consideration the scale of the elements of the GA Concept. There is no recommended ZoI, and guidance from the National Parks and Wildlife Service (NPWS) recommends that the distance should be evaluated on a case-by-case basis with reference to the nature, size and location of the plan/project, the sensitivities of the ecological receptors, and the potential for in-combination effects (cumulative).

For an effect to occur there must be a risk enabled by having a source (e.g. construction works at a proposed development site), a 'receptor' (e.g. QI or SCI of a European site), and a pathway between the source and the receptor (e.g. a watercourse which connects a plan area to an SAC, ex situ foraging habitat for SCI birds). The principle for establishing ZoI, as outlined in the 2021 OPR Practice Note PN01⁸, applies equally to a plan level AA and so the SPR method has been used in this report.

The identification of the European sites within the ZoI has been carried out by utilising GIS datasets from NPWS and of the European site network. The sites have been determined through the identification of the potential sources of the impacts of the GA Concept and their pathways for effect to European sites.

3.5.2 Assessment of Effects

3.5.2.1 Understanding the Conservation Objectives of European Sites

The COs of European sites are focused primarily on maintaining or restoring the favourable conservation status of the habitats and species of interest (i.e. the QIs and SCIs). European sites have Site-Specific Conservation Objectives (SSCOs), which focus on the specific populations of the qualifying habitat or species at that site by setting targets for appropriate attributes. The detailed SSCO area available from the NPWS website²⁵ and outline the attributes and targets for respective QIs and SCIs of European sites.

3.5.2.2 Assessment of Effects of the GA Concept

Guidance documents (see Section 3.3) provide proposed criteria to determine if a proposal is likely to have adverse effects. These criteria are particularly suited to AA of individual projects, as detail on the receiving environment will be available for analysis when project locations are known.

3.5.2.3 In-Combination Assessment of Effects

The assessment of in-combination effects is difficult, as effects on particular European sites are expected, in particular with large scale projects and/or plans. The consideration of in-combination effects discusses the potential for other projects and/or plans that may spatially or temporally overlap with the GA Concept.

3.5.3 Mitigation Measures

After establishing the elements of the GA Concept which could result in likely significant effects to a European site, mitigation measures are proposed to avoid or reduce such harmful effects. This NIS outlines the relevant measures which have been included in the GA Concept to mitigate the potential adverse effects on the integrity of European sites identified and provides an assessment of whether with such mitigation, implementation of the GA Concept elements has the potential to result in adverse effects on the integrity of European sites.

²⁵ NPWS Conservation Objectives. Accessed at <https://www.npws.ie/protected-sites/conservation-management-planning/conservation-objectives> March 2024.

4. Screening Assessment

4.1 Overview

As per the methodology stated in Section 3.5, the potential connectivity between the implementation of the GA Concept and European sites and their respective QIs/SCIs is identified via the SPR method. This identifies the potential impact pathways such as land, air, hydrological pathways etc which may support direct or indirect connectivity. Where connectivity exists between the GA Concept and receptors, these receptors are taken forward to the assessment of likely significant effects. This section of the report establishes the ZoI of the GA Concept, the potential effects of its implementation and the identification of European sites at risk of adverse effects.

4.2 Identification of Potential Sources of Impacts

In identifying the potential impacts of the implementation of the GA Concept, it is important to note that this risk is an estimation based on scientific evidence and best practice. It does not constitute that an impact will occur or that it will result in ecological or environmental damage resulting in significant effects on European sites within the ZoI. The significance of the effect is dependent upon factors such as duration, magnitude and intensity of the project/plan in question and the existence of a credible SPR link. It is also determined by the extent of the exposure to the risk and the characteristics of the receptor.

By establishing a credible source and pathway, the receptors i.e. the QI habitats and QI/SCI species, are only considered where links are identified to be credible. Factors include distance between receptors and sources and the means by which the pathway through air, water, ground etc., occurs.

The objectives and principles of the GA Concept are examined in this scenario to account for any potential for impacts that may arise following their implementation. Certain activities such as construction, operation and decommissioning may arise from the implementation of the GA Concept objectives and principles and could give rise to the impacts identified further in this section. The wording of the GA Concept objectives and principles was examined for the purposes of this assessment to ascertain whether the potential for such activities could exist. In the scenario where no potential impact may arise from implementation, e.g. feasibility studies, these are considered to not result in LSE and not considered further within the screening assessment.

Identified impacts are incorporated within the screening assessment to determine whether they result in a LSE upon identified receptors (i.e. European sites), wherein there exists the possibility that the COs of those receptors may be undermined⁸. This factors in the viability of pathways for effect (Section 4.3). The impacts are identified following the methodology presented in Section 3.5 and the guidance referenced in Section 3.3.

The assessment of the objectives and principles concluded that future infrastructure development and related construction works and associated operation and decommissioning is likely to occur within the GA Concept period. As the GA Concept is designed to guide the development of the site through phased projects, exact details regarding construction and operation are yet undecided. Each of the GA Concept objectives and principles have been assessed for potential impacts which can be found in Appendix A1. A summary of those impacts is provided below.

As a result, and following the precautionary principle, the potential direct and indirect impacts as a result of its implementation have been identified as follows:

- Accidental pollution event;
- Underwater noise and vibration;
- Habitat fragmentation or degradation;
- Habitat loss (direct habitat loss and loss of functionally linked land);
- Aerial noise, lighting and human presence-related habitat and species disturbance;

- Surface water run-off/dust carrying suspended silt or contaminants to the marine environment;
- Species mortality or injury (direct and/or indirect);
- Spread of invasive species; and
- Temporary species disturbance and displacement.

This report provides an analysis using the SPR method to determine the relationship between each source of impact, pathway for effect and receptor. Further information relating to the potential impacts can be found in Appendix A.

4.3 Identification of Potential Pathways

Establishing the potential pathways involves considering the geographical and topographical elements of the site at Moneypoint in addition to any in-situ features which may act as a barrier between the potential sources of impact and potential receptor European sites.

4.3.1 Characteristics of the Moneypoint Site

A full description of the habitats and land use types is provided in Section 2 of the GA Concept but a summary is presented here to inform the identification of potential pathways between the Moneypoint site and potential European site receptors.

Moneypoint is a man-made site, levelled to facilitate the development of the infrastructure on site with the landscape naturally rising northwards from the coastline. The built environment of the Moneypoint site encompasses a large industrial facility including a power station and substations as well as overhead powerlines and towers, wind turbines and ash storage areas. A 380m long jetty structure which facilitates marine operations limited to coal and Heavy Fuel Oil (HFO) importation. The jetty is connected on the landward edge via a 105m approach equipped with a roadway, conveyor housing, oil and water pipeline and electrical cabling.

The site is bounded by the Shannon Estuary to the south and east and banked by upward sloping ground to the north and the west. The immediate shoreline along the site boundary is protected by a (approx.) 10m high line of rock armour with a small area of low rocky cliff at the eastern end of the site. Ballymacrinan Bay, a portion of which sits within the boundary of the GA Concept, is a short shoreline characterised by cobble and gravel beach sloping upwards to the N67 road.

The west of the site is immediately bounded by an area of dense scrub backed onto areas of agricultural land and residential properties. An established woodland spans a significant portion of the site's northern boundary, extending in an east-west direction and extends north along the upward terrain. The Ash Management Zone, which covers the majority of the western land-use is bounded by soil berms and screened via planting, boundary fencing and the sloping of the site southwards to the coast.

4.3.2 Pathway: Hydrological Connectivity

Surface water runoff from some of the terrestrial areas of the Moneypoint site discharges directly into the Shannon Estuary and indirectly via the Ballymacrinan stream. Furthermore, the GA Concept Coastal Infrastructure Zone lies within the aquatic environment of the Shannon Estuary and is inclusive of existing estuarine infrastructure including the jetty.

Surface water runoff from the site has the potential to enter into the Shannon Estuary given it immediately bounds the Moneypoint site. The Ballymacrinan stream flows in a north-east to south-west direction through the Ash Management Zone and discharges into the Lower Shannon after being culverted under the N67. There are no other known watercourses within the Moneypoint site.

Surface water runoff within the site is intercepted via a series of drainage channels which feed into settlement tanks capturing run off from the existing coal storage and processing grounds. All emissions to water are managed under licence from the EPA and can be found in full detail in Appendix A2 of the GA Concept.

As discussed above at Section 2.2, the use of HFO at the site until 2029 as part of a broader transition of the site to lower carbon energy, remains a part of the t GA Concept. The use of the HFO at the Moneypoint site, including the transportation and delivery of HFO, poses the risk of oil spill from tankers transporting HFO to the Moneypoint Site. While such risks are deemed to be mitigated through the measures which are conditioned in association with the approval of that specific and consented project, any residual risk remaining is considered relevant to the GA Concept.

All areas of the Shannon Estuary which are subject to surface water discharge from the Moneypoint site (directly or indirectly) or are subject to the movement and delivery of HFO (at Moneypoint Jetty) lie within the boundary of the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA. The existence of a hydrological linkage, and associated impact pathway for surface water runoff, sedimentation and pollution effects including oil spills, between the site and these European sites is therefore established.

The Lower Shannon is a highly dynamic tidal environment and is subject to significant inputs of sediments in addition to background levels of pollutants which are contributed across a catchment of approximately 17,800 km². It is anticipated therefore that any inadvertent inputs to the marine environment would be readily diluted and dispersed within the immediate vicinity and therefore the potential for LSE upon further, more distantly situated European sites, outside of the Shannon Estuary, is negligible. It is considered however that there is an exception to this, namely the potential for LSEs arising as a result of a large-scale (catastrophic) oil spill associated with the transportation and delivery of HFO to the site. Such an event would have potential to act over a relatively greater area and as such a ZoI of 120 km for marine SACs and SPAs has been chosen to accord with that applied in respect of the assessment undertaken of the consented project for transition of the Moneypoint site from coal to HFO³.

In addition to the potential for impacts associated with the inadvertent release of hydrocarbon pollutants, sediments and other materials into the Shannon Estuary, the extent and location of the GA Concept Coastal Infrastructure Zone, within the estuarine environment itself, also raises the potential for underwater noise and vibrational effects upon a number of European sites which are more widely linked to the site via marine waters. This is inclusive of a large number of sites designated on account of the supported populations of Annex I marine mammal species.

The established ZoI for underwater noise and vibration effects is considered to be inclusive of the entirety of the respective Management Units for the relevant Annex I marine mammal species, namely harbour porpoise *Phocoena phocoena* and common bottlenose dolphin *Tursiops truncatus* which overlap with the proposed Coastal Infrastructure Zone²⁶ in addition to SACs within the known typical foraging ranges of grey seal *Halichoerus grypus* and harbour seal *Phoca vitulina*²⁷.

Therefore it is considered that hydrological connections exists between the GA Concept and the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA in addition to a range of further European sites, included at Table 2.

4.3.3 Pathway: Functionally linked land

Survey records from 2022 and 2023 from in-situ surveys at Moneypoint were obtained and reviewed²⁸ to establish the potential of the Moneypoint site to serve as functionally linked to QIs/SCIs.

Survey data notes 37 breeding bird species and 18 wintering bird species were observed within the terrestrial footprint of the site. Annex I bird species including black-headed gull (*Chroicocephalus ridibundus*), common gull (*Larus canus*), herring gull (*Larus argentatus*), mallard (*Anas platyrhynchos*), ringed plover (*Charadrius hiaticula*), teal (*Anas crecca*), kestrel (*Falco tinnunculus*), kittiwake (*Rissa tridactyla*), lapwing (*Vanellus vanellus*), redshank (*Tringa totanus*) and snipe (*Gallinago gallinago*) were all observed within

²⁶ IAMMWG. 2023. Review of Management Unit boundaries for cetaceans in UK waters (2023). JNCC Report 734, JNCC, Peterborough, ISSN 0963-8091.

²⁷ Carter, M. I. D. et al. (2020) Habitat-based predictions of at-sea distribution for grey and harbour seals in the British Isles. Sea Mammal Research Unit, University of St Andrews, Report to BEIS, OESEA-16-76/OESEA-17-78.

²⁸ RPS (2023) ESB Moneypoint OWF Hub Project. Ecological Survey for Birds Report. IE000210RP0029.

four zones of the site (Ash Management Zone, Marine Energy Zone and Buffer Zone). Ringed plover were observed foraging within the Ash Management Zone during habitat mapping surveys in 2022²⁹.

Bird surveys undertaken of the Shannon Estuary by the Irish Whale and Dolphin Group (IWDG) on behalf of ESB, from October 2021 to February 2023 and set out within quarterly reports, recorded a range of further bird species populations within the wider estuary which, while inclusive of a range of SCI species of the River Shannon and River Fergus Estuaries SPA are also included as SCIs of a range of more distantly situated SPAs. This includes a number which are within the 120 km ZoI applied to the GA Concept in respect of potential HFO spills, as discussed above.

Foraging distances were examined for each species³⁰ identified on-site to ascertain which European sites may be within the ZoI. European sites which have the SCI species observed during site surveys includes the River Shannon and River Fergus Estuaries SPA; Mid-Clare Coast SPA (15km from site boundary); Illaunonearuan SPA (20km from site boundary) and Loop Head SPA (25km from site boundary).

Based on the survey data collected over a two-year period for terrestrial habitats within the Moneypoint site, it remains inconclusive to definitively establish that any terrestrial areas of the site comprise functionally linked land for any particular SCI bird populations associated with any nearby SPAs. However, the potential for such a functional linkage cannot be entirely dismissed.

Given that more distantly situated SPAs (than the River Shannon and River Fergus Estuaries SPA) are located at least 15 km from the Moneypoint site, and given the range of bird species recorded to utilise terrestrial areas of the Moneypoint site, it is considered unlikely that the SCIs of these sites are at risk of direct or indirect impacts resulting from impacts to the terrestrial areas of the Moneypoint site, as there exists an abundance of alternative and similar habitat for the SCIs that is more proximate to their respective SPA boundaries.

It is noted however that the Shannon Estuary itself, within which the proposed Coastal Infrastructure Zone is proposed, is inclusive of estuarine portions of the River Shannon and River Fergus Estuaries SPA. These areas of the estuary are known to be used on at least a sporadic basis for foraging, wintering and during migration for a range of SCI bird populations likely to be associated with more distantly situated SPAs. It is considered likely that these SPAs have been captured within the assessment, within the 120km ZoI for HFO spill effects, as discussed above.

In addition to consideration of potential functional linkage for SCI bird populations, the possibility that areas of terrestrial and estuarine habitat within the Moneypoint site have functional linkages to the Lower River Shannon SAC and further SACs respectively is also considered.

The vast majority of the Annex II QI species of the Lower River Shannon SAC are aquatic species which are either present within the estuary or within upstream freshwater areas of the SAC. In the case of the latter (including freshwater pearl mussel *Margaritifera margaritifera* and brook lamprey *Lampetra planeri*) it is considered that there is no potential for functional linkage. In the case of QI species which occur within the estuary there is no potential for terrestrial habitats within the Moneypoint site (lying outside of the SAC boundary) to offer suitable functionally linked habitat with the exception of otter *Lutra lutra*.

QI otter populations associated with the Lower River Shannon SAC have potential to use areas of the terrestrial Moneypoint site for the construction of holts/dens, however it is noted that this would be limited to areas which are not subject to regular disturbance, inclusive of areas within the Woodland Zone. However, it is noted that such areas of the site offer poor connectivity to aquatic habitats within the Shannon Estuary and are separated from the estuary by areas of significantly disturbed industrial land. In the context of the wider areas of habitat available to the species throughout the Shannon Estuary and its environs, it is considered highly unlikely that habitats within the Moneypoint site constitute functionally linked land for QI otter populations of the Lower River Shannon SAC.

As the River Shannon and River Fergus Estuaries SPA is immediately adjacent to the GA Concept boundary, and SCIs have been recorded onsite, it is plausible to infer that the SCIs of this SPA site are

²⁹ RPS (2023) ESB Moneypoint OWF Hub. Ecology Baseline Report. IE00210RP0030. A01

³⁰ Foraging distances for species observed during 2022/23 are: Black-headed gull (18.5km); common gull (23km), herring gull (23km), mallard (), ringed plover (30m from shorelines), teal (23km), kestrel (23km), kittiwake (23km), lapwing, redshank, snipe.

functionally linked to the Moneypoint site. Areas of the Shannon Estuary within the proposed Coastal Infrastructure Zone are likely to comprise habitat used by SCI populations of more distantly situated SPAs, within 120km of the GA Concept area.

It is considered that areas of the Moneypoint site, outside of the Lower River Shannon SAC boundary are highly unlikely to offer functionally linked habitat for mobile Annex II QI features of the SAC.

4.3.4 Pathway: Aerial Connectivity

Aerial connectivity relates to potential impacts arising through dust, aerial noise and visual disturbance.

Emissions from proposals arising from the implementation of the GA Concept (which can include construction, operation and decommissioning activities) may have the potential of settling on or dispersing to relevant European sites. Emissions may include, but are not limited to, dust, construction material, oxides, greenhouse gases such as methane and particulate matter. Depending on the distances between the source and the receptor, and in consideration of the prevailing wind conditions, aerial connectivity may serve as a pathway for effect.

Prevailing wind direction dominates from the south and west, blowing in a north and easterly direction. Potential aerial emissions from the GA Concept's implementation could spread fairly widely as a result but would depend directly upon the source's size. It is not possible at this stage, given the lack of detail on the proposed extent and nature of construction works, to ascertain how far potential emissions associated with construction works or management of ash as set out within the GA Concept could spread.

However, previous studies on quarrying activities^{31 32}, including practices such as crushing, blasting and drilling of aggregate which are known to create large quantities of fine particulate dust, have been recorded, in a worst-case scenario, to give rise to dust emissions which dispersed or settled to background levels within a distance of 1.2 km and with the vast majority of material deposited within 400m of the works location. It is not envisaged that the general works proposed under the GA Concept, within the various relevant activity zones, are likely to give rise to dust generating activities analogous to quarrying activities, with predicted effects considered likely to be minor by comparison. The site already operates under licence issued by the Environmental Protection Agency (EPA) which requires adherence to a number of conditions including that regarding the operation of the site in line with strict limits on dust emissions.

In consideration of previous studies on dust dispersion, the probable extent and nature of the works which will arise from the GA Concept and the distance between Moneypoint and various nearby European sites, it is considered that the potential for aerial connectivity is limited to the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA.

In addition to potential aerial borne particulate matter, the proximity of the Moneypoint site to the Shannon Estuary also raises the possibility of aerial borne noise and visual disturbance associated with any proposed works occurring in proximity to or within the Lower River Shannon SAC and River Shannon and Fergus Estuaries SPA. Such effects are expected to vary from small-scale temporary and short-term disturbance effects associated with terrestrial construction works arising from the GA Concept and longer-term and potential larger-scale disturbance effects arising from the ongoing use of the Moneypoint Hub for the purposes of ORE construction and maintenance.

It is considered that such aerial noise and visual disturbance effects are likely to be limited to the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA. This conclusion is drawn in light of the probable transitory nature of the use of the Shannon Estuary by SCI bird populations originating within or otherwise associated with further, more distantly situated SPAs. Such populations are unlikely to be present on a regular or long-term basis and are highly unlikely to be reliant on the relatively small area to

³¹ Sairanen, M., Rinne, M. and Selonen, O., 2018. A review of dust emission dispersions in rock aggregate and natural stone quarries. *International Journal of Mining, reclamation and environment*, 32(3), pp.196-220.

³² Silvester, S., Lowndes, I., Docx, J. and Kingman, S., 2006, December. The application of computational fluid dynamics to the improved prediction of dust emissions from surface quarrying operations. In *Proceedings of the Fifth International Conference on CFD in the Process Industries*, CSIRO, Melbourne, Australia (pp. 1-6).

be potentially affected by aerial noise or visual disturbance effects in significant numbers, given their lack of inclusion within the qualifying SCI species of the River Shannon and River Fergus Estuaries SPA.

It is therefore considered that the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA share direct aerial connectivity to the GA Concept boundary.

4.3.5 Pathway: Habitat Loss

The GA Concept is inclusive of an area of privately owned foreshore encompassing the Coastal Infrastructure Zone. This area is inclusive of the existing Moneypoint jetty in addition to areas of the Shannon Estuary to the south of the existing Moneypoint site. The GA Concept includes for a range of principles guiding development including for the Coastal Infrastructure Zone. These principles also include the potential for development of the Coastal Infrastructure Zone in the future to facilitate ORE industry use of the site.

The areas of the Shannon Estuary which lie within the GA Concept Coastal Infrastructure Zone are located entirely within the boundary of the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA.

The formal conservation objectives for the Lower River Shannon SAC illustrate the distribution of the QI Annex I habitats within the SAC boundary. The GA Concept Coastal Infrastructure Zone is inclusive of areas which have been identified as either Annex I reef [1170] or estuaries [1130] habitat. In addition, an area of the Annex I QI habitat perennial vegetation of stony banks [1220] is present outside of, but adjacent to, the westernmost extent of the Coastal Infrastructure Zone.

In regard to Annex II QI species of the Lower River Shannon SAC, areas of the Shannon Estuary within the Coastal Infrastructure Zone are also noted as being within the known 250m commuting buffer for the otter; are likely to support migrating Annex II fish species including salmon *Salmo salar*, sea lamprey *Petromyzon marinus* and river lamprey *Lampetra fluviatilis* and are known to be of critical importance for common bottlenose dolphin populations within the Lower River Shannon SAC.

As such it is considered that there is potential for the provisions of the GA Concept to give rise to the loss of areas of Annex I QI habitat within the Lower River Shannon SAC in addition to areas of habitat of importance for a range of Annex II QI species of the SAC.

The areas of the GA Concept Coastal Infrastructure Zone which lie within the River Shannon and River Fergus Estuaries SPA are noted as comprising largely open waters of the Shannon Estuary. The Shannon Estuary shoreline along the southern boundary of the Moneypoint site comprises steep rock armour and consequently a relatively narrow intertidal zone comprising mostly fucoid seaweeds. As such, it is considered that the Moneypoint site offers relatively limited intertidal habitat for foraging waders and waterbirds of the SPA. Open water estuary habitat is however considered to represent important wetland habitat for a range of SCI bird species associated with the SPA and representative of the SCI Wetland and Waterbirds [A999].

It is therefore considered that there is potential for the provisions of the GA Concept to give rise to the loss of areas of SCI wetland habitat of the River Shannon and River Fergus Estuaries SPA.

On the basis of the above it is considered that the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA lie within the GA Concept area boundary and as such there is potential for direct habitat loss effects upon each of these European sites.

4.4 Identification of Potential Receptors

The potential impacts of the GA Concept are broad, given the lack of detail regarding the extent and nature of infrastructure development, construction, operation and decommissioning information likely to arise as a result of the adoption of the GA Concept. The potential pathways have been identified in Section 4.3, thus focusing the list of potential receptors that may be impacted. Given their proximity to the Moneypoint site the primary European sites of relevance are determined to be the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA given that the proposed Coastal Infrastructure Zone overlaps the boundary of both of these European sites. In addition, hydrological and aerial connectivity is supported

between Moneypoint and the SAC and SPA and areas of land within the Moneypoint site may serve as functionally linked land to the SPA.

In addition to the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA the GA Concept has potential to result in impacts to a range of more distantly situated SACs and SPAs, primarily through the identified pathways of underwater noise and vibration (all SACs within the marine mammal management units within the which the Moneypoint site lies) and the potential for large-scale oil spill associated with ongoing use of HFO at the Moneypoint site (marine or coastal SACs and SPAs within 120km of the site by hydrological connection).

The relevant designated QIs and SCIs of the respective sites can be found in Table 2.

4.5 European Sites Under Consideration

In establishing the ZoI of the GA Concept, consideration has been given to those European sites with direct and indirect connectivity to the site at Moneypoint and the associated aspirations for each of the relevant activity zones identified within the GA Concept. The topography of the Moneypoint site and any geographical and anthropogenic barriers have been identified and considered in the assessment.

Establishing the pathways for effect has led to the identification of the following sites and their respective QIs and SCIs, within the ZoI of the GA Concept, as set out in Table 2.

As discussed above, this is inclusive of all SACs and SPAs with coastal or marine QI features within 120km of the Moneypoint site by hydrological connection, which is considered to be the zone of influence for a large-scale spill of HFO in addition to a range of SACs designated for marine mammal QI species for which the known management units overlap with the Moneypoint site.

Table 2 European sites within the Zone of Influence of the Concept.

Site code	Site name	Distance from GA Concept boundary	Code	Qualifying Interests/Special Conservation Interests	Considered further in Screening Assessment
IE000 2165	Lower River Shannon SAC	Within the GA Concept boundary – Coastal Infrastructure Zone	1110	Sandbanks which are slightly covered by sea water all the time	Yes.
			1130	Estuaries	Direct and indirect pathways through habitat loss, hydrological and aerial connectivity.
			1140	Mudflats and sandflats not covered by seawater at low tide	The NPWS status of protected habitats and species viewer ¹⁷ was used to identify the locations of habitats and species within the ZoI of the GA Concept area. The following QI receptors have been identified:
			1150	Coastal lagoons	Sandbanks which are slightly covered by sea water all the time
			1160	Large shallow inlets and bays	Estuaries
			1170	Reefs	Mudflats and sandflats not covered by seawater at low tide
			1220	Perennial vegetation of stony banks	Coastal lagoons
			1230	Vegetated sea cliffs of the Atlantic and Baltic Coasts	Large shallow inlets and bays
			1310	Salicornia and other annuals colonizing mud and sand	Reefs
			1330	Atlantic salt meadows (<i>Glaucopuccinellietalia maritima</i>)	Perennial vegetation of stony banks
			1410	Mediterranean salt meadows (<i>Juncetalia maritimi</i>)	Freshwater pearl mussel
			3260	Water courses of plain to montane levels with the <i>Ranunculion fluitantis</i> and <i>Callitriche-Batrachion</i> vegetation	Sea lamprey
			6410	<i>Molinia</i> meadows on calcareous, peaty or clayey-silt-laden soils (<i>Molinion caeruleae</i>)	River lamprey
			91E0	Alluvial forests with <i>Alnus glutinosa</i> and <i>Fraxinus excelsior</i> (<i>Alno-Padion</i> , <i>Alnion incanae</i> , <i>Salicion albae</i>)	Brook lamprey
			1029	<i>Margaritifera margaritifera</i> Freshwater Pearl Mussel	Atlantic salmon
			1095	<i>Petromyzon marinus</i> Sea lamprey	Common bottlenose dolphin
			1096	<i>Lampetra planeri</i> River lamprey	Otter
			1099	<i>Lampetra fluviatilis</i> Brook lamprey	All other QI features within the SAC exist outside the ZoI of the GA Concept.
			1106	<i>Salmo salar</i> Atlantic salmon	
			1349	<i>Tursiops truncatus</i> Common dolphin	
			1355	<i>Lutra lutra</i> Otter

4.6 Screening Assessment

A screening assessment using the SPR method has been carried out, assessing the potential for likely significant effects based upon the objectives and principles for development, establishing a viable pathway for effect and the identified receptors of European sites. This assessment is provided below in Table 3. The full text for the objectives and principles can be found in Appendix A.1.

Table 3 Screening Assessment of the GA Concept

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
Objective 1	A broad vision statement guiding the intention for Moneypoint to continue to support economic development and activity. No LSE anticipated.	No potential impacts identified.	No pathway for effect.	No receptors.
Objective 2	Construction/operation/dec ommissioning is likely as a result of this objective and due to proximity to SACs/SPAs it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; River Shannon and River Fergus Estuaries SPA SCIs; Marine and coastal SACs and SPAs within the ZoI for large-scale oil spill. QI marine mammal populations of relevant SACs within the ZoI.
Objective 3	Construction/operation/dec ommissioning is likely as a result of this objective and due to the Coastal Infrastructure Zones location within the SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
Objective 4	Construction/operation/dec ommissioning is likely as a result of this objective and due to the Coastal Infrastructure Zones location within the SAC/SPA it is likely that	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance;	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; River Shannon and River Fergus Estuaries SPA SCIs;

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
	significant effects may occur as a result.	Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement		QI marine mammal populations of relevant SACs within the ZoI
MEZ1	Construction/operation/decommissioning is likely as a result of this objective and due to proximity to SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
MEZ2	Principle accounts for having regard to sensitivities, it does not suggest what type of development, or when it may occur.	No potential impacts identified.	No pathway for effect	No receptors.
MEZ3	Construction/operation/decommissioning is likely as a result of this objective and due to proximity to SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
MEZ4	Construction/operation/dec ommissioning is likely as a result of this objective and due to proximity to SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
MEZ5	Principle gives regards to how sites will adhere to legislation, licences and consents.	No potential impacts identified.	No pathway for effect	No receptors.
MEZ6	Construction/operation/dec ommissioning is likely as a result of this objective and due to proximity to SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
MEZ7	Construction/operation/dec ommissioning is likely as a result of this objective and due to proximity to SAC/SPA it is likely that significant effects may occur as a result.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
MEZ8	No Construction/operation/dec ommissioning suggested	No potential impacts identified.	No pathway for effect	No receptors.

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
MEZ9	Potential for Construction/operation/dec ommissioning is inferred in this principle for the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in Construction/operation/dec ommissioning.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
CIZ1	Development within the SAC. Direct impacts predicted.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
CIZ2	Proposed development suggests Construction/operation/dec ommissioning	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
CIZ3	Principle is surrounding collaboration with Shannon Estuary operators however, addition of the 'to develop additional support infrastructure' suggests construction/operation/decommissioning activities	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
CIZ4	Only pertains to electrical supply requirements.	No potential impacts identified.	No pathway for effect	No receptors.
CIZ5	Potential for Construction/operation/decommissioning is inferred in this principle for the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in Construction/operation/decommissioning.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
CIZ6	Potential for Construction/operation/decommissioning is inferred in this principle for the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in Construction/operation/decommissioning.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
CIZ7	Pertains to assessment criteria	No potential impacts identified.	No pathway for effect	No receptors.
CIZ8	Development within the SAC. Direct impacts predicted.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
CIZ9	Development within the SAC. Direct impacts predicted.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
IEZ1	Current operation would have been assessed within its own licencing procedures. On a precautionary basis impacts arising from ongoing use of HFO are deemed relevant.	Accidental pollution event.	Hydrological;	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; Marine and coastal SACs and SPAs within the ZoI for large-scale oil spill.

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
IEZ2	Phased development generates potential for cumulative impacts over time.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
IEZ3	Development options including above and below ground potential to result in LSE on QIs/SCIs.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
IEZ4	Pertains to feasibility studies and proposals, not likely to result in LSE.	No potential impacts identified.	No pathway for effect	No receptors.
IEZ5	Construction/operation/dec ommissioning elements relating to replacement includes removal and installation with potential for indirect effects.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
IEZ6	Principle outlines ESB position on giving regard to planning policy and ecological sensitivities.	No potential impacts identified.	No pathway for effect	No receptors.
IEZ7	Only pertains to electrical supply requirements.	No potential impacts identified.	No pathway for effect	No receptors.
AMZ1	ESB will manage this zone in accordance with the appropriate licences and consents.	No potential impacts identified.	No pathway for effect	No receptors.
AMZ2	Consideration for LSE captured at consent and license stage	No potential impacts identified.	No pathway for effect	No receptors.
AMZ3	Consideration for LSE should be captured at DMP and CRAMP stage	No potential impacts identified.	No pathway for effect	No receptors.
AMZ4	Construction/operation/decommissioning elements relating to replacement includes removal and installation with potential for indirect effects.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI.
AMZ5	Principle outlines ESB position on giving regard to hydrogeology and ecological sensitivities.	No potential impacts identified.	No pathway for effect	No receptors.
AMZ6	Assumed that any reuse of landfilled material would be subject to licensing and consenting procedures which would include consideration of environmental and ecological factors.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI.

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
AMZ7	Construction/operation of new development within ASA with potential for indirect effects.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI.
AMZ8	Potential for Construction/operation/dec ommissioning is inferred in this principle for the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in Construction/operation/dec ommissioning.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
AMZ9	Potential for Construction/operation/dec ommissioning is inferred in this principle for the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in Construction/operation/dec ommissioning.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
GDZ1	Development with potential construction/operation/decommissioning and operational issues	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
GDZ2	Pertains to considerations that will be made during project level. Consideration of appropriate design of new development that considers the landscape and visual aspects.	No potential impacts identified.	No pathway for effect	No receptors.
GDZ3	Precautionary approach to screen in - potential for development and construction/operation/decommissioning related activities	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
BZ1	Proximity to SAC has potential for effects, even if development is 'low level'	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality;	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
		Spread of invasive species; and Temporary species disturbance and displacement.		
BZ2	Pertains to having regard for ecological sensitivities. Not connected to construction/operation/decommissioning/operation.	No potential impacts identified.	No pathway for effect	No receptors.
BZ3	Pertains to having regard for archaeological sensitivities. Not connected to construction/operation/decommissioning/operation.	No potential impacts identified.	No pathway for effect	No receptors.
BZ4	Precautionary approach to screen in - potential for development and Construction/operation/decommissioning related activities	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
TAZ1	No new development proposed within this principle. New development is proposed in principle TAZ2 and mitigation shall be proposed within that objectives.	No potential impacts identified.	No pathway for effect	No receptors.

Code	Potential to act/give rise to a source of impact?	Source	Pathway	Receptor
TAZ2	Precautionary approach to screen in - potential for development and construction/operation/decommissioning related activities.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI
SZ1	Relates to existing infrastructure and relevance to landscape and visual impacts.	No potential impacts identified.	No pathway for effect	No receptors.
SZ2	Pertains to existing structure and relevance to landscape and visual impacts.	No potential impacts identified.	No pathway for effect	No receptors.
WZ1	No LSE anticipated	No potential impacts identified.	No pathway for effect	No receptors.
WZ2	Precautionary approach to screen in - potential for development and construction/operation/decommissioning related activities.	Accidental pollution event; Habitat fragmentation and degradation; Habitat loss; Aerial noise, vibration, lighting and human presence-related habitat and species disturbance; Underwater noise and vibration; Surface water run-off/dust carrying suspended silt or contaminants to the marine environment; Species mortality; Spread of invasive species; and Temporary species disturbance and displacement.	Land take; Hydrological; Aerial; Functionally linked land	Lower River Shannon SAC Marine habitats in direct proximity; QI species of Lower River Shannon SAC; River Shannon and River Fergus Estuaries SPA SCIs; QI marine mammal populations of relevant SACs within the ZoI

4.7 Assessment of In-Combination Effects with other Plans or Projects

The following approach has been adopted

- Identify plans/projects that might act in combination
- Identify types of impacts that might occur
- Define the boundaries of the assessment
- Identify pathways for impacts; and

- Impact prediction and assessment.

4.7.1 Identification of plans and project that have the potential to interact with the GA Concept

This section of the report identifies those plans and projects which exhibit the potential to interact with the GA Concept. A list of the relevant plans and projects, relevant to the GA Concept have been identified below in Table 4. This is inclusive of a range of projects and plans with potential to impacts upon the Shannon Estuary and subsequently the Lower River Shannon SAC and River Shannon and River Fergus Estuaries SPA. It is considered that plans or projects affecting areas outside of the Shannon Estuary are highly unlikely to act in-combination with the GA Concept.

Table 4 In-Combination Assessment of the GA Concept with other projects and plans

Title	Description	Distance (where applicable)	Decision	Potential for In-Combination Effects
Plans				
Clare County Development Plan 2023-2029	The Clare County Development Plan 2023-2029, adopted by the Elected Members of Clare County Council in March 2023, is a strategic blueprint for the sustainable development of the county over a six-year period. The plan aligns with national and regional strategies, policies, and guidelines. It was officially initiated in September 2020 and came into effect in April 2023. The plan outlines the overall strategy for planning and development in the county, with a focus on sustainable growth and development. It undergoes regular reviews to ensure it remains relevant and effective in the face of changing dynamics, including climate action and supply chain logistics.	Within	Adopted	The County Development Plan was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated.
Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary	The Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary is a marine based framework plan to guide future development and management of the Shannon Estuary. Recently the Plan was re-published with an updated term of 2023 – 2029 and it continues to form part of the statutory plan for the area. It is understood that the SIFP is under review. The SIFP forms part of the statutory land use plan – the County Development Plan. The SIFP sets a 30-year vision for the development of the Shannon Estuary. It seeks to support the multi-functional nature of the Shannon Estuary and identify opportunities to expand the existing economic base, including Port-related industry and other related activities; while safeguard the Estuary's sensitive environmental resources and natural heritage of national, European and International significance.	Within	Adopted	The SIFP was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated.
The Regional Spatial and Economic Strategy for the Southern Region (RSES)	The RSES provides the framework through which the NPF's disruptive vision and the related Government policies and objectives will be delivered for the Region. In line with international best practise, the RSES adopts a territorially differentiated and place-based approach to regional planning and economic development.	Within	Adopted	The RSES was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated.
Shannon Foynes Port Company Vision 2041	The Vision is a strategic plan launched in 2013 setting forward the 30 year strategy for future port operations and development along 100km of the Shannon Estuary. It emphasizes the unique position of the Port of Foynes, which can accommodate large vessels and has a dedicated rail line. The plan aims to drive growth across all sectors, enter new sectors like offshore renewables and biomass, and encourage more value-added business through initiatives like port-centric logistics hubs. The strategy also focuses on customer-centric operating practices. The Vision 2041 undergoes a review every 7 to 10 years to adapt to changing opportunities and obligations around climate action and supply chain logistics.	Within	Adopted	The Vision and its 2022 review was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated.

Title	Description	Distance (where applicable)	Decision	Potential for In-Combination Effects
Draft Clare County Biodiversity Action Plan 2025-2031	This draft plan is the fourth biodiversity action plan for Clare, aiming to halt biodiversity loss and enhance ecological resilience. It focuses on habitat restoration, mainstreaming biodiversity in local authority operations, education, and collaborative partnerships. The plan aligns with Ireland's National Biodiversity Action Plan (2023–2030) and supports climate adaptation goals. An AA Screening Report was prepared for the draft plan in July 2025.	Within	In consultation	The Draft Biodiversity Action Plan was subject to an AA Screening. No likely significant effects were found to exist as the plan is designed to incur positive impacts upon biodiversity. As a result, no in-combination effects are anticipated.
Clare County Heritage Plan 2040-2030	The Heritage Plan provides a strategic framework for safeguarding Clare's cultural, built, and natural heritage. It promotes sustainable tourism, climate resilience, and community engagement, with actions to integrate heritage into planning and education. Developed through extensive consultation, the plan reflects national heritage policy and local priorities. The plan includes a section on Appropriate Assessment within its appendices.	Within	Adopted	The County Heritage Plan was subject to was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated
Kerry County Development Plan 2022-2028	This plan provides a comprehensive spatial strategy for Kerry, aiming to balance economic growth with environmental stewardship. It addresses housing, infrastructure, and climate adaptation, embedding biodiversity protection and flood risk management throughout its policies. The plan also integrates national and regional objectives, including Project Ireland 2040. The Kerry County Development Plan underwent full AA screening and Stage 2 Appropriate Assessment, documented in its Natura Impact Statement.	5km	Adopted	The County Development Plan was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated
Limerick County Development Plan 2022-2028	The Limerick County Development Plan sets out a statutory framework for sustainable growth across city and county, integrating housing, transport, economic development, and environmental protection. It promotes compact settlement patterns, climate resilience, and green infrastructure while aligning with the National Planning Framework and Southern Regional Spatial and Economic Strategy. The plan was screened for AA and progressed to Stage 2 Appropriate Assessment, resulting in a full Natura Impact Statement (Volume 4 of the plan).	30km	Adopted	The County Development Plan was subject to AA Screening and NIS. A suite of mitigation measures were provided within the NIS to conclude no adverse effects on the integrity of any European site. No potential in-combination effects anticipated
Projects				
Planning Application 2360393 (Clare)	For development which will consist of: 1 No. enclosed battery energy storage system compound on a total of c. 6.2 hectare site, to include: 1 no. 220kv GIS electrical substation building and 1 no. single storey customer substation building, control and switch room, 220kv transformer and four no. auxiliary transformers, up to 192 battery storage blocks on concrete support structures including heating, ventilation and air conditioning unit (HVAC units), 16 transformer and 32 inverter units. Including access tracks and site entrance, associated electrical cabling and ducting, security gates, perimeter security fencing, CCTV system, landscaping works and all associated ancillary	10.8km north east	Further Information Stage	This planning application is currently under review for 'further information.' This development has been subject to a Screening for AA which concluded the potential for likely significant effects upon the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA. The requirement for full AA has been identified as part of a request for further submission on 14/11/2023 and is awaiting submission.

4.8 Summary

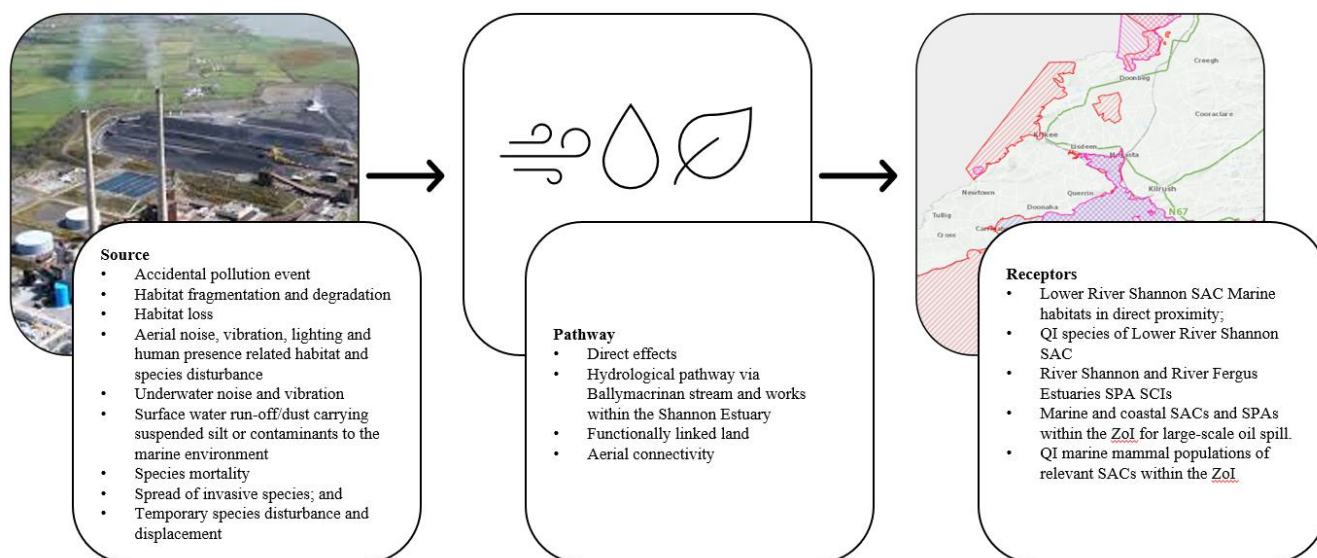

Figure 2 Summary of Source-Pathway-Receptor model for AA of the GA Concept

The SPR method has been used to define the ZoI of the GA Concept and a screening exercise (Appendix A.1) has been carried out to delineate which of the GA Concept objectives and principles have the potential to result in LSE to the following European sites:

- Lower River Shannon SAC
- Mid-Clare Coast SPA
- River Shannon and River Fergus Estuaries SPA
- Illaunonearaun SPA
- Kerry Head SPA
- Loop Head SPA
- Kerry Head Shoal SAC
- Magharee Islands SPA
- Magharee Islands SAC
- Akeragh, Banna and Barrow Harbour SAC
- Dingle Peninsula SPA
- Kilkee Reefs SAC
- Tralee Bay Complex SPA
- Tralee Bay and Magharees Peninsula, West to Cloghane SAC
- Carrowmore Dunes SAC
- Carrowmore Point to Spanish Point and Islands SAC
- Cliffs of Moher SPA
- Inishmaan Island SAC
- Inisheer Island SAC
- Inishmore Island SAC
- Black Head-Poulsallagh Complex SAC
- Blasket Islands SAC
- Blasket Islands SPA
- Kilkieran Bay and Islands SAC
- Inishmore SPA
- Valencia Harbour/Portmagee Channel SAC
- Inagh River Estuary SAC
- West Connacht Coast SAC
- Belgica Mound Province SAC
- Roaringwater bay and Islands SAC
- Hook Head SAC
- Carnsore Point SAC
- Blackwater Bank SAC
- West Wales Marine / Gorllewin Cymru Forol SAC
- Bristol Channel Approaches / Dynesfeydd Môr Hafren SAC
- Mers Celtiques – Talus du Golfe de Gascogne SAC

- Rockabill to Dalkey Island SAC
- Codling Fault Zone SAC
- Lambay Island SAC
- North Anglesey Marine / Gogledd Môn Forol SAC
- Nord Bretagne DH SAC
- Ouessant Molène SAC
- Abers-Côte des Légendes SAC
- North Channel SAC
- Baie de Morlaix SAC
- Côtes de Crozon SAC
- Chaussée de Sein SAC
- Tregor Goëlo SAC
- Récifs et landes de la Hague SAC
- Anse de Vauville SAC
- Banc et Récifs de Surtainville SAC
- Baie de Saint Briec – Est SAC
- Chausey SAC
- Cap d’Erquy-Cap Fréhel SAC
- Baie du Mont Saint-Michel SAC.

The objectives identified as giving rise to LSEs are Objective 2, Objective 3 and Objective 4.

The principles identified (26 in total) are:

- MEZ1; MEZ3, MEZ4, MEZ6, MEZ7, MEZ9
- CIZ1, CIZ2, CIZ3, CIZ5, CIZ6, CIZ8, CIZ9
- IEZ1, IEZ2, IEZ3, IEZ5
- AMZ4; AMZ6, AMZ7, AMZ8
- GDZ1, GDZ3
- BZ1, BZ4
- TAZ2
- WZ2.

No in-combination effects are anticipated, however impacts associated with the granted ABP case 319080 (the conversion of the Moneypoint power station from coal to HFO) are also considered in respect of the GA Concept, inclusive of the ongoing transport and delivery of HFO to the site.

As potential likely significant effects have been identified, the GA Concept must proceed to stage 2 AA. This is set out within the below Natura Impact Statement (Section 5), with mitigation recommended, where appropriate, in Section 6.

5. Natura Impact Statement

5.1 Overview

This assessment considers the impacts that the 26 GA Concept objectives and principles, for which there is a pathway for effect, will have on the integrity of the sites below as they relate to their respective conservation objectives within the ZoI.

The potential effects have been assessed in the absence of any mitigation measures, and with consideration to the precautionary principle. Since the proposed objectives and principles are high-level and limited both in detail and in timeline, the discussion of the likelihood of any adverse effect is high-level.

The information provided within this document should be built on and used to guide and inform AA of future plans and projects arising from this GA Concept, where relevant. This would include an assessment of the QIs/SCIs, site specific conservation objectives, current condition of the relevant European sites (including supplementary advice if available) and potential effects on QIs/SCIs as a result of each proposed plan/project, to determine appropriate mitigation (if required) and any adverse effects on integrity of the site.

This section determines whether the impacts identified in Section 4.2 could have significant effects on the QIs and SCIs of the European sites identified in Section 4.4 in view of the COs of the sites. At this point in time, detail surrounding the magnitude, scale and duration of any future projects is lacking and as such this is a precautionary assessment.

As outlined in Section 4.2, the potential impacts arising from the GA Concept are as follows:

- Accidental pollution event;
- Habitat fragmentation or degradation;
- Habitat loss;
- Aerial noise, vibration, lighting and human presence-related habitat and species disturbance;
- Underwater noise and vibration;
- Surface water run-off/dust carrying suspended silt or contaminants to the marine environment;
- Species mortality;
- Spread of invasive species; and
- Temporary species disturbance and displacement.

The assessment of effects will focus first on the Lower River Shannon SAC, the River Shannon and River Fergus Estuaries SPA and then subsequent more distant European sites which have been screened in for impacts associated with large-scale oil spills associated with the use of HFO at the site only and those which have been screened in for impacts associated with underwater noise.

5.2 Lower River Shannon SAC

5.2.1 Overview

The Lower River Shannon SAC extends from Killaloe in Co. Clare to Loop Head / Kerry Head spanning a distance of 120km, with a maximum width of 15km and water depths of 40m at its mouth to less than 5m deep in the inner estuary³³. The SAC is characterised by a multitude of estuaries that contribute to its unique ecological diversity. These estuaries facilitate the convergence of freshwater and marine water, leading to brackish environments within the SAC. Tidal ranges can vary up to 5.5m during spring tides³³.

³³ Fouz, D.M., Carballo, R., López, I., & Iglesias, G. (2021). Tidal stream energy potential in the Shannon Estuary. Renewable Energy.

Consequently, this has led to the establishment of a variety of habitats, as listed in Table 2, that warrant protection due to their ecological significance. Such habitats support QI species of otter, common bottlenose dolphin, freshwater pearl mussel, sea lamprey, brook lamprey, river lamprey and Atlantic salmon. The COs for the Lower Shannon SAC can be accessed at the NPWS website³⁴.

Available datasets from NPWS³⁵, Inland Fisheries Ireland³⁶, and Irish Whale and Dolphin Group were reviewed for the distribution of QI habitats and species of the Lower Shannon SAC. Maps provided in Appendix B.1 and Appendix B.2 show the distribution of QI habitats and the supporting habitats of QI species respectively.

The QI habitat ‘1220 perennial vegetation of stony banks’ is separated from the terrestrial boundary of the GA Concept area by the N67 road and associated road verge. However, the proposed Coastal Infrastructure Zone lies adjacent to a point location mapped as supporting this Annex I habitat which may extent to areas within the boundary of the Coastal Infrastructure Zone. A band of ‘1170 reefs’ is located along the shoreline at Ballymacrinan, adjacent to the Ash Management Zone and a section of the Marine Energy Zone and within the Coastal Infrastructure Zone. ‘1130 Estuaries’ habitat is located immediately adjacent to the entire terrestrial Moneypoint site and within all areas of the Coastal Infrastructure Zone. The remainder of the QI habitats designated under the SAC are located both upstream and downstream from the site. Given that the site is tidal in nature, limited potential effects on upstream habitats cannot be fully ruled out however, due to the significant dispersion and dilution that would occur through the movement of water within the Shannon, potential impacts would be extremely limited depending on the magnitude of the impact and the distance from the source.

Data records²⁹ highlight the presence of otter along the shoreline of the Moneypoint site with multiple spraints, couches and mammal trails identified within 2022/2023. Field survey results from the 2022/2023 survey effort identified possible holts located within the rock armour along the Coastal Infrastructure Zone. Bottlenose dolphin are present throughout the year within the River Shannon with the estuary an important calving area²¹ (See Appendix B2). Bottlenose dolphins have been recorded in the estuary all year round with a peak from May to September with the presence of neo-natal calves from July to September as evidence of a well-defined breeding season in the Shannon Estuary³⁷.

The Cloon River, located approximately 10km upstream of the GA Concept, is known to support populations of the Atlantic salmon. Atlantic salmon travel upstream in the winter months to spawn, and as such the potential for Atlantic salmon to be present adjacent to the GA Concept area exists.

A catchment for the freshwater pearl mussel is located approximately 10km upstream from the Moneypoint site. The species requires clean, fast-flowing freshwater rivers to survive, burrowing between the boulders and pebbles present within. Given that the waterbody adjacent to Moneypoint is saline/brackish, and that freshwater pearl mussels exist > 10km upstream, the potential for direct effects to this species is negligible and not considered further in this report. Impacts upon salmon, given their ecological function as a host species for larval freshwater pearl mussel, particularly impacts leading to a reduction in the overall population of juvenile salmon within a freshwater pearl mussel breeding habitat have potential to give rise to indirect adverse effects upon freshwater pearl mussel. It is considered therefore that impacts discussed below with potential to impact upon salmon populations would also have potential to result in subsequent effects upon this species however these are not treated separately in the below discussion.

Brook lamprey are a freshwater species and would not be anticipated to be found within the ZoI of the GA Concept area due to its saline environment. There are no records of brook lamprey using the Ballymacrinan stream nor are there records of brook lamprey within the ‘Shannon Estuary North’ catchment within which Ballymacrinan stream is located.

³⁷ Rogan E., Ingram S., Holmes B., & O' Flanagan C. (2000) A Survey of Bottlenose Dolphins (*Tursiops truncatus*) in the Shannon Estuary; Marine Resource Series, Marine Institute 2000; Available: <https://oar.marine.ie/handle/10793/208>

As the stream is culverted, it is considered that there would be a significant barrier to movement of brook lamprey and this species is not considered further within the assessment. Sea lamprey and river lamprey are migratory in nature, spawning in freshwater systems and found within coastal waters, estuaries and oceans. The Shannon estuary is both an important habitat and transit area for both sea and river lamprey and as such are considered to be within the ZoI.

5.3 Assessment of Effects on the Lower River Shannon SAC

5.3.1 Accidental Pollution Event

A number of objectives and principles of the GA Concept pertain to future development at the Moneypoint site and as such the potential for an accidental pollution event exists. An accidental pollution event during construction is an unforeseen incident that could lead to the discharge of harmful substances. This could be due to the disturbance of buried waste, accidental leaks and spills of hazardous materials, or the unintentional spread of existing pollution. Accidental leaks and spills of hazardous materials from machinery in operation onsite has the potential to enter the Lower Shannon SAC, whilst the disturbance of ground such as that within the Ash Management Zone and Marine Energy Zone (where the coal storage area is active) could indirectly introduce contaminants. Furthermore, the ongoing use of HFO as a fuel at the Moneypoint site, particularly during transport and delivery, raises the potential for a large-scale oil spill into the marine environment of the Shannon Estuary.

Water pollution or toxic effects associated with the release of contaminants, including HFO, can directly or indirectly affect the QI marine habitats and species outlined in Section 5.2.1. Owing to the close location of the marine QI habitats to Moneypoint, these habitats could be affected both directly and indirectly by the construction and operational activities at the project level. As fish species (Atlantic salmon, sea lamprey and river lamprey), otter and common bottlenose dolphin exist within the marine environment, an accidental pollution event may indirectly affect the species through water pollution.

5.3.2 Habitat Fragmentation and Degradation

Habitat fragmentation is defined as the process during which a large expanse of habitat is transformed into a number of smaller patches of smaller total area, isolated from each other by habitats which are unlike the original³⁸. Owing to the potential for construction emanating from a range of objectives and principles of the GA Concept the potential for habitat fragmentation and/or degradation may occur to indirectly to marine QI habitats of the Lower Shannon SAC.

The SAC boundary extends from the high water mark out into the marine area, with annex habitats of perennial vegetation of stony banks, reefs and estuaries found immediately adjacent to the terrestrial Moneypoint site and within the boundary of the Coastal Infrastructure Zone. The potential for indirect habitat fragmentation and/or degradation has the potential to occur arising from land-based activities such as construction and/or operation of future infrastructure. Fragmentation and/or degradation may occur arising from land take within the boundary of the SAC, changes in water flow emanating from the site e.g. the Ballymacrinan stream, through the deposition of dust and or construction related material or through an accidental pollution event. Habitat within the foreshore environment may degrade to the point where fragmentation occurs or suffer changes in structure.

5.3.3 Habitat loss

The loss of habitat which is a QI of a European site or that supports a QI/SCI of a European site may occur where GA Concept objectives or principles result in direct or indirect habitat loss through construction and/or operation related activities. Objective 2, Objective 3, Objective 4, MEZ1, MEZ3, CIZ1, CIZ2, CIZ3, CIZ7, IEZ2, IEZ3, IEZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2, SZ1 all have the potential to indirectly result in habitat loss to the Lower Shannon SAC.

³⁸ Fahrig, L. (2003). Effects of Habitat Fragmentation on Biodiversity. *Annual Review of Ecology, Evolution, and Systematics*, 34, 487–515. <http://www.jstor.org/stable/30033784>

Furthermore CIZ1, CIZ2, CIZ3, CIZ5, CIZ7 and CIZ8 all involve the proposed development of areas within boundary of the Lower River Shannon SAC, inclusive of areas which have been mapped as comprising the Annex I QI habitats reef, estuaries and potentially perennial vegetation of stony banks.

Development within the terrestrial areas of the Moneypoint site is likely to involve construction and owing to the proximity of reefs, estuaries and perennial vegetation of stony banks to the boundary of the site, there is the possibility that habitat may be indirectly lost. Changes in water flowing into the site, through deposition of dust and or construction related material, through an accidental pollution event. Perennial vegetation of stony banks is currently under pressure from activities relating to the modification of coastline, estuary and coastal conditions for development²³.

Direct land-take within the SAC boundary may arise as a result of the proposed principles for the development of the Coastal Infrastructure Zone.

The COs for the habitat of perennial vegetation of stony banks stipulate that the area of this habitat should remain stable or exhibit an increasing trend. Furthermore, the distribution of this habitat should not undergo any decline or alteration. The physical structure, along with the structure and composition of the vegetation, should be preserved. Additionally, the presence of any species that serve as negative indicators should be absent. Similarly for reefs and estuaries, habitat area and community distribution should not decline and in particular for reefs, its habitat distribution should remain stable. These COs aim to ensure the conservation and sustainability of this unique habitat.

Owing to the potential for construction in the zones adjacent to these habitats, indirect and direct loss of Annex I QI habitat cannot be ruled out. Such effects would be considered likely to represent an adverse effect upon the integrity of the site.

5.3.4 Aerial noise, vibration, lighting and human presence-related habitat and species disturbance;

A number of objectives and principles of the GA Concept pertain to future development at the Moneypoint site and as such the potential for disturbance arising through aerial noise, vibration, lighting and human presence related disturbance exists.

The Moneypoint power station is in continuous operation, running 24 hours a day, seven days a week. This results in constant activity on the premises, including staff presence, vehicular traffic, deliveries, noise, and artificial lighting among other things. Given this scenario, it's reasonable to believe that any otters on the site would have adapted to the ongoing operations. The likelihood of the site works causing any substantial disruption to the otters is considered to be extremely low. However, as the magnitude and scale of future developments is as of yet unknown, there is potential that an increase above this baseline could result in direct disturbance to otter. In particular, where developments may occur within the Coastal Infrastructure Zone and Marine Energy Zone, direct disturbance to the species is possible.

The COs for otter within the Lower Shannon SAC are to preserve the current distribution of the species, the extent of terrestrial, freshwater and terrestrial habitats, the number of couching sites and holts and to avoid any declines in fish biomass or increases in barriers to connectivity. Due to the potential impacts arising from future construction activities, coupled with the presence of human activity and related infrastructure, there exists a potential risk of undermining the COs.

While there is a potential for visual disturbance to common bottlenose dolphin due to the presence of machinery and personnel within the Moneypoint site, this is considered to be negligible and not expecting to result in a level of impact that would adversely affect the bottlenose population at the site.

There is a lack of connectivity between land-based works and therefore effects arising from this impact are not anticipated for river lamprey or sea lamprey.

5.3.5 Underwater Noise and Vibration

A range of objectives and principles of the GA Concept, particularly those relating to the Coastal Infrastructure Zone including CIZ1, CIZ2, CIZ3, CIZ5, CIZ6, CIZ7, CIZ8 and CIZ9 in addition to further principles relating to zones adjacent to the marine environment are likely to involve development within or in proximity to the estuarine environment of the Shannon Estuary. Such development, in the absence of further detailed information on the extent and nature of the nature of the construction etc., is assumed to have potential to give rise to underwater noise and vibration effects within the Shannon Estuary.

Underwater noise and vibration arising from works within or adjacent to the aquatic environment is known to give rise to potential adverse effects upon aquatic species including auditory injury to marine mammals through temporary or permanent threshold shift (TTS or PTS) and/or associated disturbance and displacement associated with lower sound levels, in addition to injury to fish species including salmon³⁹.

Areas of the Shannon Estuary within the Coastal Infrastructure Zone and within the wider estuary environment in close proximity to the Moneypoint site are mapped as comprising critical habitat for common bottlenose dolphin populations within the Lower River Shannon SAC.

Common bottlenose dolphin has hearing in the high frequency range (150-160 kHz) and utilises these frequencies to communicate and navigate through echolocation. Auditory injury to the species can therefore interfere with the animals' essential systems for survival and communication. The National Oceanic and Atmospheric Administration (NOAA) publishes a technical guidance document for assessment of underwater criteria for auditory injury to marine mammals⁴⁰. This document sets out that the auditory injury onset criteria for high-frequency cetaceans for impulsive noise is 193dB (cumulative sound exposure level) to 230dB (peak sound pressure level). For non-impulsive noise, the onset criteria for auditory injury is 201dB.

Data published by Southall et al. (2019)⁴¹, differs slightly from the NOAA Technical guidance, and is inclusive of a threshold for TTS for high frequency cetaceans at non-impulsive noise levels of 178dB and PTS at 198dB. This paper also discusses the propensity for marine mammals to avoid sources of underwater noise, including those which are below the thresholds for auditory injury which may also have potential to give rise to short to long term displacement effects upon the species.

Any works within or adjacent to the estuarine environment which arise as a result of the GA Concept with potential to give rise to underwater noise are, on a precautionary basis, assumed to give rise to potential underwater noise levels above the respective thresholds for TTS and PTS for common bottlenose dolphin and/or sufficient to result in non-auditory injury related disturbance and displacement of the QI species populations.

While it is known that underwater noise can give rise to injury and mortality of salmon³⁹, this principally relates to impacts arising from percussive piling, other studies associated with piling activities within the marine environment^{42, 43} have recorded fairly minimal behavioural reactions or evidence of injury arising to salmon as a result of such works.

Where avoidance of a source of underwater noise by salmon is possible it is considered likely that the species will avoid such sources which would otherwise give rise to injury of the species. As such, the primary adverse effect arising upon QI populations of the species through underwater noise is considered likely to be disturbance and displacement over the short to long-term depending upon the nature of the proposed works. On a precautionary basis it is assumed that works would have potential to give rise to injury to the species, in addition to disturbance or displacement effects. As discussed above, impacts to salmon populations have potential to give rise to associated effects upon freshwater pearl mussel, river lamprey and sea lamprey.

5.3.6 Surface water run-off/dust carrying suspended silt or contaminants to the marine environment

Sedimentation is a naturally occurring event within freshwater and marine waterbodies, originating from the weathering and erosion of underlying bedrock, stream beds and tidal action. The Moneypoint site is crisscrossed by roads, and features numerous parking lots and other paved areas, all of which are integrated into the existing on-site surface water management system. To the east of the power station, there is a substantial coal storage area, as well as a Flue Gas Desulphurization (FGD) landfill area. Presently, the operations on the site do not result in any notable environmental impacts, as there is no evidence of surface water runoff or dust transporting suspended silt or pollutants into the marine environment.

However, as there is the potential for numerous developments to occur on-site within the GA Concept period, there is the potential for surface water run-off to carry dust or contaminants to the marine environment, thereby directly impacting the marine annex habitats located immediately adjacent. Where normal levels of sediment are increased, this can result in adverse effects on QI marine and coastal habitats and species through the deterioration of water quality, changes in turbidity etc. Objective 2, Objective 3, Objective 4 and principles MEZ1, MEZ3, MEZ4, MEZ6, MEZ7, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2 and SZ1 all have the potential to result in increased sediment or contaminants entering the marine environment. Therefore annex habitats of perennial vegetation of stony banks, reefs and estuaries may be directly impacted by the aforementioned objectives and principles and indirectly affect the QI species (i.e. otter and bottlenose dolphin) which exist within this area.

5.3.7 Species mortality

The GA Concept, in its current form, carries an indirect risk of causing harm to QI species, specifically otter and common bottlenose dolphin. This risk is associated with the construction activities that may arise from the GA Concept objectives and principles. Should otters be present in the vicinity during these activities, they could potentially be harmed or even face mortality due to disturbances or habitat destruction. Similarly, the potential risk to dolphin species exists in the event of an accidental pollution incident. Dolphins are particularly vulnerable to changes in water quality. Therefore, if an unforeseen pollution event were to occur, such as a chemical spill or the release of harmful substances into the water bodies, it could have detrimental effects on the common bottlenose dolphin population, potentially leading to mortality.

In a similar vein, alterations in water quality or the occurrence of a pollution event, given the right magnitude, could potentially lead to fatalities among sea lamprey, river lamprey, and Atlantic salmon. However, the actual impact would largely depend on whether these fish species are present in the affected area at the time of the pollution event. This highlights the complex interplay between environmental factors and the presence of aquatic life in determining the ecological consequences of such incidents.

GA Concept principles of MEZ1, MEZ3, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3 and IEZ5 all have the potential to generate activities which may result in species mortality. Given that the COs for these Annex species relate to preservation of the population and avoidance of disturbance, and with the lack of detail within the GA Concept, the risk of mortality to the QI species of Lower Shannon SAC cannot be out ruled.

5.3.8 Spread of invasive species

Potential future construction activities could inadvertently lead to the introduction or proliferation of invasive species. This risk could stem from various sources such as machinery, plants, or personnel that are transported to the site from different locations. These elements could potentially carry seeds, spores, or even small plants that are not native to the site.

Furthermore, vessels and other marine construction operations will involve the potential for introduction of non-native invasive aquatic organisms including molluscs, crustaceans, among others. Once introduced, these invasive species could gain a foothold and start to spread, causing a variety of impacts including degradation of habitat, loss of biodiversity, and even contamination of the site. Objective 2, Objective 3, Objective 4 and principles MEZ1, MEZ3, MEZ4, MEZ6, MEZ7, MEZ9, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2 and SZ1 all have the potential to result in the introduction or spread of invasive species as a result of future construction activities.

5.3.9 Temporary species disturbance and displacement

Construction activities, particularly those that are large-scale or disruptive, can lead to temporary species disturbance and displacement. This is primarily due to the noise, vibration, and physical changes to the environment that these activities entail. Species, especially those that are sensitive to changes in their habitat, may be forced to leave their usual territories in search of quieter, safer areas. This displacement can disrupt feeding, breeding, and other essential behaviours, potentially impacting the overall health and survival of the species.

This would include noise and movement by both machinery and humans on-site at Moneypoint which could be resultant from construction and operation activities associated with future projects arising from the GA Concept. Machinery movement, construction and/or decommissioning activities and the presence of personnel can potentially disturb otter species from their resting places along the rock armour and foreshore area. As a result, the otter's range and habitat can be directly impacted due to disturbance upon or near to functionally linked land. Where otter are forced to escape disturbed sites, there is often the case where they are required to travel further resulting in increased energy expenditure. Further elements of the GA Concept, namely the proposals for the Coastal Infrastructure Zone, present a further mechanism for disturbance of marine species including bottlenose dolphin and salmon, with associated potential impacts upon river lamprey, sea lamprey and freshwater pearl mussel.

GA Concept Objective 2, Objective 3, Objective 4, MEZ1, MEZ3, MEZ4, MEZ6, MEZ9, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2 and SZ1 all have the potential to generate activities which may result in the temporary disturbance and displacement of otter from their habitat.

5.4 River Shannon and River Fergus Estuaries SPA

5.4.1 Overview

The River Shannon and River Fergus Estuaries SPA is an internationally significant site located in Ireland spanning a surface area of approximately 322 km², with 95% of this area being marine. The SPA is recognized for its importance in supporting an assemblage of over 20,000 wintering waterbirds.

The SPA is home to internationally important populations of four species: the light-bellied brent goose, dunlin, black-tailed godwit, and redshank. In addition to these, the SPA protects cormorant, whooper swan, shelduck, wigeon, teal, pintail, shoveler, scaup, ringed plover, golden plover, grey plover, lapwing, knot, bar-tailed godwit, curlew, redshank, greenshank, and black-headed gull. COs have been set to maintain or restore the favourable conservation condition of the waterbird species. The COs targets for non-breeding SCIs are to maintain or increase the long-term population, no significant decrease in range timing or intensity of use of areas by SCIs and to maintain the wetland habitat designated within the site.

The ecology of the SCIs varies significantly due to adaptations and specialisations that dictate their use of different habitats, influencing their distribution across the SPA. The reliance on and usage of alternative habitats fluctuates among species, seasonally, daily, and even between day and night. When high tides cover tidal flats, waterbirds that forage intertidally are unable to do so and may relocate to nearby fields for feeding. Some species, like the black-tailed and bar-tailed godwits, curlew and redshank are generalists and utilise a variety of habitats, foraging across intertidal mudflats and also readily using grassland habitats. Light-bellied brent geese alter their habitat preference when food resources in one area become scarce, resorting to grasslands when intertidal seagrass and algae are depleted.

The extensive intertidal mudflats along the estuary provide an ideal food resource for wintering waterfowl. The SPA's designation is not only crucial for the protection of these species but also for the preservation of their habitats. The atypical foraging habitats for the respective SCIs is listed below⁴⁴:

- Intertidal mud and sand flats (at low tide): Ringed plover, golden plover, grey plover, lapwing, knot, dunlin, black-tailed godwit, shelduck, light-bellied brent goose, whooper swan, teal, bar-tailed godwit, curlew, redshank and greenshank
- Sheltered and shallow subtidal over sand and mudflats: cormorant, black-headed gull, teal and widgeon
- Lagoon and associated habitats: whooper swan and shoveler
- Shallow subtidal: shelduck and pintail; and
- Subtidal: scaup.

Survey data from 2022/2023 confirms the presence of SCIs black-headed gull, lapwing, redshank, ringed plover and teal within the Moneypoint site¹⁹. According to data from NPWS, there are no roost locations within the GA Concept area, with the nearest roost locations found downstream at Rusheen (3.3km south) and Leadmore West (6.3km west). Given the Moneypoint site's status as an electricity generation location, its habitats have been significantly altered. The species for which the SPA is designated for associate with and depend on tidal, intertidal, and estuarine habitats. These habitats contrast starkly with those available within the GA Concept area, which are either entirely terrestrial and disturbed above the high-water mark, or heavily modified, such as the rock armour present within the Coastal Infrastructure Zone. These habitats do not resemble or provide the same ecological functions as those required by the SCIs. Behavioural limitations restrict the ability of the populations to utilise alternative locations. It is anticipated that these species will continue to favour the ecologically valuable habitats within the designated European site over any within or near the GA Concept location.

5.5 Assessment of Effects on the River Shannon and River Fergus Estuaries SPA

5.5.1 Accidental Pollution Event

The accidental and unintentional release of chemicals to the Lower Shannon from potential construction activities on-site could indirectly impact the SCIs of the SPA through changes to their food availability within the receiving estuarine habitats. A number of wading birds are designated as part of the SPA, which forage at low tide within the sediment immediately adjacent to the GA Concept boundary. An accidental release of chemicals and/or contaminants arising either from machinery leak or the disturbance of contaminated land (e.g. Ash Management Zone or coal storage area within the Marine Energy Zone) could contaminate the receiving environment and introduce such contaminants into the food chain of the dependent SCIs. Furthermore, the ongoing use of HFO as a fuel at the Moneypoint site, particularly during transport and delivery, raises the potential for a large-scale oil spill into the marine environment of the Shannon Estuary.

Additionally, should contaminants be released over an extended period of time, the cumulative build-up of contaminants could lengthen potential changes to dependent SCIs. It must be noted the worst-case scenario is dependent upon the magnitude and duration of the accidental pollution event and coincide with lower tide levels when there is an opportunity for contaminants to settle within the sediment. It is anticipated that should a pollution event occur during high tides or stormy conditions; the tidal power of the Lower Shannon would contribute to the dispersion and dilution of contaminants over the area and as such would have a negligible impact.

⁴⁴ NPWS (2012b). River Shannon & River Fergus Estuaries. Special Protection Area (Site Code 4077). Conservation Objectives Supporting Document. Version 1. National Parks & Wildlife Service

Given that the species records for the terrestrial areas of the site are limited to black-headed gull, lapwing, redshank, ringed plover and teal, it is anticipated that both redshank and ringed plover may be at the greatest risk of an indirect impact through an accidental pollution event as a result of contamination of functionally linked land. Objectives 2, 3 and 4 and principles CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ3, BZ1, BZ4, TAZ2 and SZ1 of the GA Concept pertain to future development at the Moneypoint site and due to the potential for construction and new operation, the potential for an accidental pollution event exists.

In the event of a large-scale spill of HFO at the site, it is considered that all SCIs of the Lower River Shannon SPA would be highly likely to be significantly impacted through surface oiling effects, subsequent oiling of plumage and associated mortality, and temporary loss of foraging habitat within the estuary and adjacent areas of intertidal mud and sand.

5.5.2 Habitat Fragmentation and Degradation

Habitat fragmentation modifies the habitat and leads to the creation of isolated or loosely connected patches of the original habitat. The result is a disruption of habitat units that were once more continuous. This disruption diminishes or even eradicates connectivity, a crucial aspect of the conservation status of any natural or semi-natural habitat, irrespective of its legal status, and has a negative impact on biodiversity.

The adverse effects of habitat fragmentation can increase the isolation of species or populations, which can harm the resilience or robustness of these populations, thereby decreasing overall species diversity and changing species abundance. Although the direct impacts of fragmentation on mobile species are less apparent, the indirect effects on these species due to habitat fragmentation are indisputable.

SCIs recorded on site (Section 4.3.1) have established the precedent that the Moneypoint site serves as functionally linked land to the SPA. Owing to the potential that future construction may occur within GA Concept area, habitat fragmentation and/or degradation may arise as a result. Additionally impacts arising from potential future construction may result in degradation to dependent habitats of the SCIs, including lapwing, ringed plover, redshank and black-headed gull. Future development changes to the Marine Energy Zone, Coastal Infrastructure Zone and the Ash Management Zone (where species were recorded) may result in habitat fragmentation and/or degradation causing species to move further afield to forage, breed and rest thereby causing an indirect impact through excessive energy expenditure.

Owing to the potential for construction emanating from Objective 2, Objective 3, Objective 4, MEZ1, MEZ3, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2, SZ1 the potential for habitat fragmentation and/or degradation may occur to directly to the habitats within the Ash Management Zone, Marine Energy Zone and Coastal Infrastructure Zone.

5.5.3 Habitat loss

The loss or destruction of habitat occurs where there is a complete removal or conversion of a habitat type; for example, arising from future infrastructure development at the Moneypoint site. Changes to functionally linked habitat to the SCIs of the SPA could result in the direct loss of a particular habitat necessary for the functions of the species. Objective 2, Objective 3, Objective 4, MEZ1, MEZ3, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2, SZ1 all have the potential to result in habitat loss to functionally linked land on-site.

The GA Concept aims to transition the Moneypoint from a coal fired energy generation plan to renewable energy with the principles guiding development identifying elements of particular construction activities. These include the construction of infrastructure, structure replacement, ORE related infrastructure, the development and enhancement of coastal infrastructure and changes in land use. As a result, and with the lack of exact detail currently available over timelines and scale of construction and operation, at this stage of assessment, it is impossible to rule out the loss of functionally linked habitat on-site that supports SCIs of the SPA.

Furthermore, the objectives and principles within the GA Concept relating to the development of the Coastal Infrastructure Zone including CIZ1, CIZ2, CIZ3, CIZ5, CIZ8 and CIZ8, are likely to give rise to the loss of areas of estuarine habitat within the SPA which are likely to comprise wetlands inclusive of the SCI wetland and waterbirds of the SPA. The loss of these areas of habitat are assumed to represent an adverse effect upon the integrity of the site.

5.5.4 Aerial noise, vibration, lighting and human presence related disturbance to species

Wader and waterbird species are known to be highly sensitive to disturbances such as noise, vibration, lighting, and human activity. Noise and vibration, often resulting from construction or heavy machinery, can disrupt their natural behaviours, including feeding, breeding, and migration patterns. These disturbances can cause stress, leading to decreased health and reproductive success. Artificial lighting can disrupt the natural day-night cycle, affecting behaviours such as sleep and migration. It can also disorient birds, leading to collisions with artificially lit structures. Human activity, especially in or near their habitats, can lead to displacement and habitat loss. These species often perceive humans as predators, causing them to flee and abandon their nests. Over time, these disturbances can lead to population declines and changes in community structure.

A large range of objectives and principles of the GA Concept all have the potential to result in indirect disturbance to the SCIs of the SPA through future construction.

5.5.5 Surface water run-off/dust carrying silt or contaminants to the marine environment

Surface water runoff and airborne dust can have significant impacts on wader and waterbird species. Surface water runoff, particularly when contaminated with anthropogenic pollutants, can degrade the quality of aquatic habitats. This can lead to the proliferation of harmful algal blooms, which can reduce oxygen levels in the water and produce toxins detrimental to avian species. Furthermore, runoff can induce erosion and sedimentation, potentially leading to the destruction of physical habitats these species rely on.

Airborne dust can affect air quality and visibility, potentially disrupting the normal behaviours of these birds. Dust particles can settle on water bodies, altering their chemical composition and potentially impacting the availability of food resources for these species. Additionally, dust can adhere to the plumage of birds, affecting their insulation properties and flight capabilities.

Objective 2, Objective 3, Objective 4 and principles MEZ1, MEZ3, MEZ4, MEZ6, MEZ7, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2 and SZ1 all have the potential to result in increased sediment or contaminants entering the marine environment as a result of future construction related activities. Species may be indirectly impacted where their habitats for foraging and resting are degraded through the release of contaminants.

5.5.6 Species mortality

Construction activities can indirectly contribute to mortality in wader and waterbird species through several mechanisms. Habitat loss is a significant concern as construction can lead to the destruction or alteration of habitats essential for feeding, breeding, and shelter. This can compel birds to relocate to less suitable areas, potentially leading to increased competition, predation, and consequently, higher mortality rates.

Additionally, the noise and activity associated with construction can disturb these species, causing stress and disrupting essential behaviours such as feeding and breeding. Over time, this can weaken the birds, making them more susceptible to disease and predation, thereby increasing mortality. Pollution from construction, including chemicals, waste materials, and sediment, can contaminate water and food sources, leading to illness or death. Construction activities often involve the use of large machinery and structures, which birds can collide with, leading to injury or death. Furthermore, construction can create physical barriers that disrupt the movement and migration of these birds, potentially leading to increased energy expenditure, collision and mortality. As discussed above, accidental pollution events, particularly in the case of a large-scale spillage of HFO, also have potential to give rise to mortality through oiling of surface waters.

Principles MEZ1, MEZ3, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3 and IEZ5 all have the potential to result in indirect species mortality arising from construction related activities.

5.5.7 Temporary species disturbance and displacement

Construction activities can precipitate temporary disturbances and displacement of SCIs through a variety of mechanisms. The noise and vibration produced by construction machinery can disrupt these SCIs, particularly during the critical breeding season, potentially leading to nest abandonment and diminished breeding success. Construction arising from the GA Concept objectives and/or principles can modify the physical landscape, potentially resulting in the destruction or degradation of foraging or resting habitats within the GA Concept area or nearby, thereby causing birds to relocate to further away areas.

The increased human presence associated with construction activities can also disturb these species, inducing stress and potential displacement. Noise can cause immediate physical stress responses in birds, similar to the ‘fight or flight’ response in mammals. This can lead to increased heart rate and stress hormone levels, which over time can weaken the birds and make them more susceptible to disease. Noise can interfere with the birds’ communication. Many bird species rely on vocal signals for various behaviours such as attracting mates, defending territory, and warning of predators. Construction noise can mask these signals, leading to misunderstandings and conflicts among birds, and potentially reducing their breeding success. Additionally, noise can disrupt feeding behaviours. Many waders and waterbirds feed in synchrony with the tides, and sudden loud noises can scare them away from feeding grounds. This can lead to reduced food intake, affecting their energy levels and overall health. If the noise level is too high, birds may choose to leave the area and move to quieter but potentially less suitable habitats. This can lead to increased competition for resources and potentially higher mortality rates.

Additionally, construction often necessitates the use of artificial lighting, which can disrupt the natural circadian rhythms and impact behaviours such as sleep and breeding. Dust and other forms of air pollution generated by construction can affect air quality and visibility, potentially impacting the health of these birds and their offspring. GA Concept Objective 2, Objective 3, Objective 4, MEZ1, MEZ3, MEZ4, MEZ6, MEZ9, CIZ1, CIZ2, CIZ3, CIZ8, IEZ2, IEZ3, IEZ5, AMZ5, GDZ1, GDZ3, BZ1, BZ4, TAZ2 and SZ1 all have the potential to generate activities which may result in the temporary disturbance and displacement of SCIs.

5.6 Large-Scale Accidental Pollution Events

In addition to the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA, which both lie within the boundary of the GA Concept area, a range of further, more distantly situated European sites are hydrologically connected to the site via the Shannon Estuary and intervening areas of the Atlantic. As set out above, at Section 4.3.2, the GA Concept will involve the ongoing use of HFO at the site, including the transport and delivery of HFO to the site via ocean-going tanker. While the potential adverse effects arising from the use of HFO at the site have already been subject to assessment within the Natura Impact Statement that informed the An Bord Pleanála consent of the scheme (319080) it is considered that a lack of consideration of this aspect of the GA Concept would represent an omission likely to be unacceptable in light of the provisions of the Habitats Directive.

The use of HFO and particularly the transport and delivery of the substance to the site has potential to give rise to a catastrophic and large-scale spillage of HFO into the Shannon Estuary in a worst-case scenario. While it is acknowledged that a strict range of procedures exist to control and mitigate the potential for such a spillage to occur such measures are considered to represent mitigation measures for the purposes of this assessment. Where such measures are not put in place large-scale oil spills can result. The large-scale spillage of HFO has potential to give rise to a range of adverse impacts upon European sites inclusive of short to medium term deterioration of QI Annex I marine habitats within SACs, surface water oiling resulting in mortality to Annex II marine species including otter with probable effects upon common bottlenose dolphin and harbour porpoise in addition to mortality of marine birds through surface water and subsequent plumage oiling effects and deterioration of important marine and intertidal foraging habitat.

As established above (Table 2), a large range of SACs and SPAs lie within the determined ZoI for a large-scale oil spill event, which was determined to be 120km for sites supporting coastal or marine Annex I QI habitats or fairly immobile coastal or marine Annex II QI species, such as otter or within the known typical foraging ranges for seal species (50km for grey seal and approximately 135km for grey seal) or the known marine mammal management unit areas for common bottlenose dolphin and harbour porpoise respectively. While the ZoI is inclusive of a large number of European sites situated beyond 120km from the Moneypoint site via the closest hydrological connection, impacts to such sites would be limited to ex-situ effects upon marine mammal populations which may be present within the proximity to the Moneypoint site.

This ZoI is considered to be inclusive of the following European sites (excluding the Lower River Shannon SAC and River Shannon and River Fergus Estuaries SPA, discussed above) which are all considered vulnerable to effects arising as a result of large-scale oil spill:

- Mid-Clare Coast SPA
- Kerry Head SPA
- Illaunonearaun SPA
- Loop Head SPA

- Kerry Head Shoal SAC
- Magharee Islands SPA
- Magharee Islands SAC
- Akeragh, Banna and Barrow Harbour SAC
- Dingle Peninsula SPA
- Kilkee Reefs SAC
- Tralee Bay Complex SPA
- Tralee Bay and Magharees Peninsula, West to Cloghane SAC
- Carrowmore Dunes SAC
- Carrowmore Point to Spanish Point and Islands SAC
- Cliffs of Moher SPA
- Inishmaan Island SAC
- Inisheer Island SAC
- Inishmore Island SAC
- Black Head-Poulsallagh Complex SAC
- Blasket Islands SAC
- Blasket Islands SPA
- Kilkieran Bay and Islands SAC
- Inishmore SPA
- Valencia Harbour/Portmagee Channel SAC
- Inagh River Estuary SAC
- West Connacht Coast SAC
- Belgica Mound Province SAC
- Roaringwater bay and Islands SAC
- Hook Head SAC
- Carnsore Point SAC
- Blackwater Bank SAC
- West Wales Marine / Gorllewin Cymru Forol SAC
- Bristol Channel Approaches / Dynesfeydd Môr Hafren SAC
- Mers Celtiques – Talus du Golfe de Gascogne SAC
- Rockabill to Dalkey Island SAC
- Codling Fault Zone SAC
- Lambay Island SAC
- North Anglesey Marine / Gogledd Môn Forol SAC
- Nord Bretagne DH SAC
- Ouessant Molène SAC
- Abers-Côte des Légendes SAC
- North Channel SAC
- Baie de Morlaix SAC
- Côtes de Crozon SAC
- Chaussée de Sein SAC
- Tregor Goëlo SAC
- Récifs et landes de la Hague SAC
- Anse de Vauville SAC
- Banc et Récifs de Surtainville SAC
- Baie de Saint Brieuc – Est SAC
- Chausey SAC
- Cap d’Erquy-Cap Fréhel SAC
- Baie du Mont Saint-Michel SAC.

In the absence of the application of mitigation measures it is assumed that the GA Concept would have potential to give rise to adverse effects on the integrity of the above listed sites through effects associated with a large-scale spillage of HFO.

5.7 Underwater Noise and Vibration

The GA Concept objectives and principles, particularly those relating to proposed future development within the Marine Energy and Coastal Infrastructure Zones which lie adjacent to and within the Shannon Estuary respectively, would have potential to give rise to underwater noise and vibration within the marine environment of the Shannon Estuary. Such underwater noise effects would, in addition to affecting areas of critical habitat for bottlenose dolphin populations of the Lower River Shannon SAC, discussed above, also have potential to give rise to ex-situ effects upon QI Annex II marine mammal populations of other SACs within the known typical foraging ranges for seal species (50km for grey seal and approximately 135 km for grey seal) or the known marine mammal management unit areas for common bottlenose dolphin and harbour porpoise respectively.

This ZoI is considered to be inclusive of the following European sites (excluding the Lower River Shannon SAC, discussed above) and the relevant QIs which are all considered vulnerable to effects arising as a result of underwater noise and vibration:

- Inishmore Island SAC – Harbour porpoise
- Blasket Islands SAC – Harbour porpoise, grey seal
- Kilkieran Bay and Islands SAC – Harbour porpoise
- West Connacht Coast SAC – Common bottlenose dolphin, harbour porpoise
- Belgica Mound Province SAC – Common bottlenose dolphin, harbour porpoise
- Roaringwater bay and Islands SAC – Harbour porpoise
- Hook Head SAC – Harbour porpoise
- Carnsore Point SAC – Harbour porpoise
- Blackwater Bank SAC – Harbour porpoise
- West Wales Marine / Gorllewin Cymru Forol SAC – Harbour porpoise
- Bristol Channel Approaches / Dynesfeydd Môr Hafren SAC – Harbour porpoise
- Mers Celtiques – Talus du Golfe de Gascogne SAC – Harbour porpoise
- Rockabill to Dalkey Island SAC – Harbour porpoise
- Codling Fault Zone SAC – Harbour porpoise
- Lambay Island SAC – Harbour porpoise
- North Anglesey Marine / Gogledd Môn Forol SAC – Harbour porpoise
- Nord Bretagne DH SAC – Harbour porpoise
- Ouessant Molène SAC – Harbour porpoise
- Abers-Côte des Légendes SAC – Harbour porpoise
- North Channel SAC – Harbour porpoise
- Baie de Morlaix SAC – Harbour porpoise
- Côtes de Crozon SAC – Harbour porpoise
- Chaussée de Sein SAC – Harbour porpoise
- Tregor Goëlo SAC – Harbour porpoise
- Récifs et landes de la Hague SAC – Harbour porpoise
- Anse de Vauville SAC – Harbour porpoise
- Banc et Récifs de Surtainville SAC – Harbour porpoise
- Baie de Saint Brieuc – Est SAC – Harbour porpoise
- Chausey SAC – Harbour porpoise
- Cap d’Erquy-Cap Fréhel SAC – Harbour porpoise
- Baie du Mont Saint-Michel SAC – Harbour porpoise.

In the absence of the application of mitigation measures it is assumed that the GA Concept would have potential to give rise to adverse effects on the integrity of the above listed sites through effects associated with underwater noise and vibration giving rise to potential auditory injury or other disturbance and displacement effects.

6. Mitigation

6.1 Overview

The purpose of mitigation in the AA process is to outline the strategies and measures to avoid, reduce or offset potential adverse effects on the integrity of European sites, their QIs and SCIs. Mitigation measures are designed to ensure, wherever possible, that the GA Concept will not adversely affect the integrity of the Lower Shannon SAC and the River Shannon and River Fergus Estuaries SPA or furthermore distantly situated European sites. The approach taken in this AA is to first identify the in-built mitigation measures outlined within the GA Concept and secondly, where adverse effects still exist, recommend mitigation measures to avoid any remaining adverse effects both alone and in-combination. Section 7.2 below outlines the in-design mitigation measures whilst Section 7.3 provides the additional recommended mitigation measures.

6.2 In Design Mitigation within the GA Concept

A number of the overarching policies of the GA Concept emphasise the protection of the natural environment. This includes OP1 which states:

“The Green Atlantic @ Moneypoint Concept will be implemented having due regard for the sensitivity of the local environment, including the adjoining coastline, which includes the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA.”

OP2 states:

“As required under prevailing legislation, development proposals will be required to comply with the requirements of the Environmental Impact Assessment and Habitats Directives”

OP3 states:

“Mitigation measures identified by project specific environmental assessment and approved as part of the statutory consenting process, will be implemented to mitigate against impacts arising on the local environment.”

OP10 states:

“Where appropriate, development proposals will be subject of design level modelling to determine any potential hydrological change that may arise and impact on the hydrology of sites within the zone of influence of the site, including European Sites designated for their international nature conservation importance. Such models will inform mitigation strategies and ensure that site infrastructure is appropriately designed.”

Throughout the GA Concept, the importance of the Lower Shannon SAC and the River Shannon and River Fergus Estuaries SPA and the below mitigation measures have been identified.

Table 5 Embedded design measures to mitigate impacts upon the Lower Shannon SAC and River Shannon and River Fergus Estuaries SPA

Land Use Zone	Mitigation identified within the GA Concept – Principles	Reference location within GA Concept
Marine Energy Zone (MEZ)	All development proposals will have regard to the prevailing land use zoning of the site, and the visual and ecological sensitivity of the adjoining coastline, noting the proximity to a European site. As such, any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC and River Shannon and River Fergus Estuaries SPA.	MEZ2 Page 19
Coastal Infrastructure Zone (CIZ)	Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA, or that circumstances prevail whereupon consent can be granted having regard to broader considerations.	CIZ2 Page 20

Land Use Zone	Mitigation identified within the GA Concept – Principles	Reference location within GA Concept
Industrial Energy Zone (IEZ)	All development proposals will be developed having regard to the prevailing land use zoning of the site, and the visual and ecological sensitivity of the adjoining coastline. Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC and River Shannon and River Fergus Estuaries SPA.	IEZ6 Page 22
Ash Management Zone (AMZ)	Any new development within this zone will be subject of robust environmental assessment to confirm that it does not impact on the on-going management of the capped ASA. Specifically a detailed Hydrogeological Risk Assessment will be prepared and a construction methodology submitted to the EPA for approval, in advance of works being permitted or commenced.	AMZ4 Page 23

6.3 Recommended Mitigation for the GA Concept

6.3.1 Overview

Mitigation measures are recommended in the following subsections. The mitigation measures are presented per the relevant QIs and SCIs that have been identified as at risk of adverse effects within this report.

It is noted that, given the nature of the GA Concept which is a relatively high-level plan document, identification of project specific mitigation measures is not always possible given the lack of detail on the extent and nature of development which is likely to arise as a result of the adoption of the GA Concept objectives and principles.

Mitigation measures required in respect of any project level development will be identified and implemented to ensure that the impacts at the project level are fully addressed wherever possible. Where mitigation is not possible, for example in the case of habitat loss effects arising from development of the Coastal Infrastructure Zone, there may be a requirement for the project to be considered in respect of Article 6(4) of the Habitats Directive. This is discussed further below.

Mitigation measures set out below should be viewed in context as overarching principles of mitigation which will be applied to individual projects arising from the GA Concept objectives and principles to mitigate impacts upon European sites.

Lower River Shannon SAC

6.3.2 Estuaries, Reefs, Perennial Vegetation of Stony Banks

The following mitigation is recommended for any future specific project proposals that may arise as a result of the GA Concept in regard to the QI marine habitats of the Lower Shannon SAC:

6.3.2.1 Estuaries

Any development associated with the Coastal Infrastructure or Marine Energy Zones will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development associated with the Coastal Infrastructure Zone and Marine Energy Zone shall be subject to a Screening for AA (and full AA where appropriate) and be carried out by a suitably qualified ecologist.
- Any future project proposals shall seek to avoid and minimise any impacts upon this habitat through careful selection of areas for development, type of infrastructure used and scale of project.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce any potential adverse effects on the COs of the habitat once the details of the type of development and the level of construction works and impacts are known; and

- Future project proposals shall seek to avoid development during sensitive seasons.

6.3.2.2 *Reefs*

Any development associated with the Coastal Infrastructure or Marine Energy Zones will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development associated with the Coastal Infrastructure Zone and Marine Energy Zone shall be subject to a Screening for AA (and full AA where appropriate) and be carried out by a suitably qualified ecologist.
- Any future project proposals shall seek to avoid any impacts upon this habitat through careful selection of areas for development, type of infrastructure used and scale of project.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the habitat once the details of the type of development and the level of construction works and impacts are known; and
- Future project proposals shall seek to avoid development during sensitive seasons.

6.3.2.3 *Perennial Vegetation of Stony Banks*

Any development associated with Coastal Infrastructure Zone and Marine Energy Zone will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below:

- Any project level development associated with the Coastal Infrastructure Zone and Marine Energy Zone shall be subject to a Screening for AA and be carried out by a suitably qualified ecologist.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the habitat once the details of the type of development and the level of construction works and impacts are known; and
- Any future project proposals shall seek to avoid any impacts upon this habitat through careful selection of areas for development, type of infrastructure used and scale of project.

6.3.3 *Otter*

- Any future project proposals associated with the GA Concept area will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined.
- Any project level development arising from the GA Concept shall be subject to a Screening for AA (and full AA where appropriate), informed by appropriately timed surveys for the species and be carried out by a suitably qualified ecologist.
- Any future project proposals shall aim to avoid construction in sensitive areas such as feeding and breeding areas, minimise the use of high noise emission activities such as impact piling and blasting.
- Any future project proposals shall aim to enforce speed limits for vehicles used in construction and establish a code of conduct to avoid disturbance to otters both during construction activities and in transit to construction area if entering areas of high abundance.
- Where piling methods are proposed as part of a project proposal, a noise and vibration assessment shall be carried out prior to any future works insofar as to avoid any potential impacts on the QI.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the species once the details of the type of development and the level of construction works and impacts are known; and
- Any future project proposals shall aim to avoid construction during sensitive periods for otter, employ soft starting procedures for any piling activities and/or passive acoustics deterrents.

6.3.4 Common Bottlenose Dolphin

Any future project proposals associated with the GA Concept will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development arising from the GA Concept shall be subject to a Screening for AA (and full AA where appropriate) and be carried out by a suitably qualified ecologist.
- Any future project proposals that may interact with the marine environment shall adhere to the NPWS 2014 Guidance to Manage the risk to Marine Mammals from Man-Made Sound Sources in Irish Waters and subsequent future iterations of the guidance.
- Any future project proposals shall aim to minimise the use of any high noise emitting activities and/or machinery within the ZoI of the foreshore area so as to avoid indirect impacts to the species.
- Where piling methods are proposed as part of a project proposal, a noise and vibration assessment shall be carried out prior to any future works insofar as to avoid any potential impacts on the QI.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the species once the details of the type of development and the level of construction works and impacts are known; and
- Any future project proposals arising from the GA Concept which has the potential to interact with common bottlenose dolphin shall consult with NPWS, IWDG and any other relevant organisations.

6.3.5 Fish species

6.3.5.1 Sea Lamprey and River Lamprey

Any future project proposals associated with the GA Concept will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development arising from the GA Concept shall be subject to a Screening for AA (and full AA where appropriate) and be carried out by a suitably qualified ecologist.
- Any future project proposals arising from the GA Concept which has the potential to interact with sea or river lamprey and their associated habitat shall consult with NPWS, Inland Fisheries Ireland and any other relevant organisations.
- Where piling methods are proposed as part of a project proposal, a noise and vibration assessment shall be carried out prior to any future works insofar as to avoid any potential impacts on the QI.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the species once the details of the type of development and the level of construction works and impacts are known; and
- Any future project proposals affecting the estuarine environment shall aim to avoid construction at sensitive times for the species.

6.3.5.2 Atlantic Salmon

Any future project proposals associated with the GA Concept will ensure that the NPWS detailed COs for the Lower Shannon SAC are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development arising from the GA Concept shall be subject to a Screening for AA (and full AA where appropriate) and be carried out by a suitably qualified ecologist.
- Where piling methods are proposed as part of a project proposal, a noise and vibration assessment shall be carried out prior to any future works insofar as to avoid any potential impacts on the QI.

- Any future project proposals arising from the GA Concept which has the potential to interact with Atlantic Salmon and its associated habitat shall consult with NPWS, Inland Fisheries Ireland and any other relevant organisations.
- Suitable mitigation measures shall be required at project level stage to avoid or reduce potential adverse effects on the COs of the species once the details of the type of development and the level of construction works and impacts are known; and
- Any future project proposals affecting the estuarine environment shall aim to avoid construction at sensitive times for the species.

River Shannon and River Fergus Estuaries SPA

6.3.6 SCIs

Any future project proposals associated with the GA Concept area must ensure that the NPWS detailed COs for the River Shannon and River Fergus Estuaries SPA are not undermined. Any exceptions to this will be addressed through Article 6(4) procedures, as discussed below.

- Any project level development arising from the GA Concept shall be subject to a Screening for AA (and full AA where appropriate), informed by an appropriate suite of bird surveys and carried out by a suitably qualified ecologist.
- For the application of any future project level proposals, dedicated site counts throughout summer and winter months will be required for any application to establish the use, if any, of birds within the GA Concept area.
- Where piling methods are proposed as part of a project proposal, a noise and vibration assessment shall be carried out prior to any future works insofar as to avoid any potential impacts on the QI
- Future project proposals shall give regard to avoidance of siting structures within sensitive areas for SCIs, avoid installation/construction works during sensitive seasons (i.e. breeding), identify then avoid construction in resting and foraging areas, avoid large-scale continuous illuminations, minimise the use of high noise emission activities (e.g. piling or blasting), integrate noise suppression techniques when appropriate and use sound insulation on plant equipment and device design; and
- Any future project proposals arising from the GA Concept which has the potential to interact with the SCIs of the SPA and associated habitat shall consult with NPWS, Birdwatch Ireland and any other relevant organisations.

Operational Phase Management of Heavy Fuel Oil

Mitigation measures governing the use, including transport and delivery of HFO, at the site have been set out within the Natura Impact Statement which accompanied the consented scheme submissions (An Bord Pleanála case 319080). While such measures are considered as comprising a part of that application, they also apply to the ongoing use of HFO at the Moneypoint site, with associated potential effects arising from large-scale spillage of HFO on a range of European sites, as discussed above.

The following measures are being and will continue to be implemented at the site for control of HFO.

6.3.7 Measures to Prevent an Oil Spill in Transit

Measures will be implemented during the transport of HFO to Moneypoint including that the vessels shipping the HFO will comply with the International Safety Guide for Oil Tankers and Terminals (ISGOTT 6) produced by Oil Companies International Marine Forum (OCIMF) and the International Chamber of Shipping (ICS). Furthermore, recommendations of the International Maritime Organization will be implemented, as necessary.

6.3.8 Measures to Address an Oil Spill within the Shannon Estuary

Moneypoint Generating Station is part of the Shannon Estuary Anti-Pollution Team (SEA-PT). SEA-PT has developed an Oil Spill Contingency Plan that covers the Shannon estuary from Limerick City to the mouth of the Shannon Estuary, at a notional line from Loop Head (County Clare) to Kerry Head (County Kerry).

The objectives of the plan are:

- To prevent further pollution/damage caused by the spill
- To contain and clean up a marine spill
- Cause no further damage to the marine environment or create unacceptable risk to those responding to or impacted by the incident.

More specifically, the plan will

- Mobilise appropriate personnel, equipment and other resources
- Make all necessary notification to relevant authorities and agencies
- Instigate appropriate containment, recovery and clean-up operations to control and mitigate the effects of the spill and contribute to the restoration of the environment
- Initiate, as appropriate, wildlife rescue and rehabilitation operations
- Gather evidence throughout the operation for possible legal action
- Maintain accurate records so that the cost of the response operation may be accurately assessed. The plan contains measures to be implemented in the event of an oil spill, including:
 - Discovery and notification of the appropriate personnel.
- Identification of a Tier 1, 2 or 3 incident:
 - Tier 1: a Tier 1 incident is one in which a small spill can be dealt with by personnel in the immediate vicinity and that has no external impact. Each installation / works area in the area of the plan has enough equipment to respond to a Tier 1 incident. In the event of a Tier 1 being activated, the spiller or installation personnel will respond in accordance with their local procedures and the Duty Harbour Master will monitor the response.
 - Tier 2: a Tier 2 incident is one that will require the combined resources of the organisations represented on the SEA-PT team. It will also require the involvement of regulatory bodies, local authorities, advisors and advisory bodies. In general, all spills in the Shannon Estuary, other than minor ones, will require a Tier 2 response. A Tier 2 response will require the activation of Shannon Foynes Port Company (SFPC) Incident Management Team and the SEA-PT. This will instigate notifications to the Coast Guard and Local Authorities and Tier 2 response specialists.
 - Tier 3: a Tier 3 incident is a major oil pollution event with potential for environmental, social and economic impacts that are beyond the capability of local resources. It will require local, national and probably international resources. A Tier 3 response is initiated by contacting the Coast Guard. A response at this level will be coordinated under the National Contingency Plan and within the Management of Major Emergencies Framework.
- Incident notification and response process is detailed
- Tier escalation matrix is provided
- An Incident Response and an Incident Action Plan are in place
- ESB has a supply of oil booms available, and this is also a requirement for the IE licence.

6.3.9 Measures for unloading of HFO

The following measures are in place and will continue to be implemented during HFO unloading:

- Oil unloading arm and valves on the jetty are manned at all times
- The full length of the HFO fuel line is inspected periodically (currently frequency, every 2 hours)
- Pressure and temperature is constantly checked and recorded
- Radio contact is maintained with the ship, the control room and persons involved in the procedure
- The oil sump located underneath the jetty is emptied prior to arrival of the oil ship
- Security is maintained on the jetty while unloading
- Firefighting equipment is positioned in place prior to arrival of the oil ship
- Oil spill containment equipment is located on the jetty
- Oil dry is positioned on the jetty (currently 2 tonne minimum)
- Jetty oil unloading arm area and the HFO. Tank head spaces are designated as Atmospheres Explosives (ATEX) Areas
- Hot work and smoking is prevented while unloading is taking place
- The pipework and valves are maintained as per oil tank and pipework technical standards.

Subject to the application of these mitigation measures it is envisaged that the risks associated with a large-scale oil spill at the site as a result of the ongoing use of HFO, would be fully mitigated.

6.4 Underwater Noise and Vibration

As set out above, in respect of the Lower River Shannon SAC and the associated QI populations of common bottlenose dolphin, projects arising from the GA Concept should be subject to their own project -specific AA, which should include an assessment of the potential underwater noise and vibrational effects arising upon marine mammals.

- Furthermore, projects arising from the GA Concept objectives and principles shall adhere to the NPWS 2014 Guidance to Manage the risk to Marine Mammals from Man-Made Sound Sources in Irish Waters and subsequent future iterations of the guidance
- Subject to the implementation of these mitigation measures it is envisaged that any likely significant underwater noise or vibrational effects upon marine mammal QI populations, including those of all SACs within the respective management units and those designated on account of seal populations within the known foraging ranges for the respective species will be fully mitigated.

6.5 Recommended Mitigation to Address In-Combination Effects

In-combination effects shall be addressed by the mitigation proposed above in the above sections. Projects and plans discussed within the in-combination assessment (Section 4.7) were assessed as incorporating their own measures, sufficient to fully mitigate any likely significant effects arising as a result of their construction or operation.

7. Requirement for Article 6(4) Assessment of Green Atlantic Concept Projects

7.1 Adverse Effect on Site Integrity

As discussed above, the GA Concept is inclusive of a number of objectives and principles, as discussed above, which are considered likely to give rise to development proposals within the identified Coastal Infrastructure Zone. This zone lies entirely within the Shannon Estuary to the south of the terrestrial Moneypoint site and is entirely within the boundary of the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA.

These areas of the SAC are mapped as comprising the Annex I habitats reef [1170] or estuaries [1130] which represent QI features of the SAC, furthermore such areas are also considered to comprise areas of wetland included within the definition of the SCI feature Wetlands and Waterbirds [A999] of the River Shannon and River Fergus Estuaries SPA.

As such, and discussed above, it is considered that should future development within the Coastal Infrastructure Zone arising from the GA Concept objectives and principles proceed, such development would have potential to give rise to adverse effects on site integrity of both the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA through permanent loss of habitat.

Given the lack of currently available detail on the extent and nature of the development which is likely to take place within the Coastal Infrastructure Zone, it is not possible to accurately assess the potential impacts of such projects. Where such projects are proposed, project-specific AA will be required to be undertaken to demonstrate the potential for likely significant effects and then, if necessary, adverse effects upon European sites.

In the event that project specific AA cannot rule out the potential for adverse effects upon the integrity of any European sites it is envisaged that ESB will be required to demonstrate that no alternative exist and that the proposed development is necessary for imperative reasons of overriding public interest (IROPI), including those of a social or economic nature. Should it be deemed by the competent authority and European Commission that the project is representative of IROPI development, the project may be able to proceed however the development proposal will also be required to demonstrate that compensatory measures have been identified for consideration by the Irish government and subsequently the European Commission. It is envisaged that extensive consultation with NPWS would be required in formulating the compensation GA Concept proposed in the event that the Coastal Infrastructure Zone is to be developed.

It is further emphasised that it is not known, at this plan-level stage, whether proposed development within the Coastal Infrastructure Zone will give rise to an adverse effect on the integrity of a European site, these considerations are only possible within individual project-level assessments arising from the GA Concept given the lack of available detail on the extent and nature of the development proposed.

7.2 Consideration of Alternative Solutions

Where projects arising from the objectives and principles of the GA Concept are deemed to give rise to adverse effects upon the integrity of a European site, the competent authority must be satisfied that there are no suitable and less damaging alternative solutions.

The provisions of the GA Concept have fed from international, national and regional policies which have set out targets for delivery of renewable energy resources throughout the EU.

These include the National Energy and Climate Plan (NECP) 2021-2030, European Commission's Green and REPowerEU at the international level, Climate Act 2021, 2023 Climate Action Plan (CAP23), national Planning Framework and National Development Plan, at the national level.

The Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary is a marine based framework plan to guide future development and management of the Shannon Estuary. Recently the Plan was re-published with an updated term of 2023 – 2029 and it continues to form part of the statutory plan for the area.

It is understood that the SIFP is under review. The SIFP forms part of the statutory land use plan – the County Development Plan.

The SIFP sets a 30-year vision for the development of the Shannon Estuary. It seeks to support the multi-functional nature of the Shannon Estuary and identify opportunities to expand the existing economic base, including port-related industry and other related activities; while safeguarding the Estuary's sensitive environmental resources and natural heritage of national, European and International significance.

The SIFP identifies two Strategic Development Locations for the development of marine related industry in the Shannon Estuary. Moneypoint (and adjacent lands) are identified as Strategic Development Location B (SDL B). The SIFP aims to protect the strategic importance of these lands and encourage their sustainable growth, development and appropriate diversification for economic development in accordance with regional and national priorities and subject to the requirements of environmental objectives.

In relation to Moneypoint, the SIFP notes:

- Significant investment to date in maritime infrastructure i.e. the large commercial jetty which has a capacity to accommodate vessels up to 250,000 tonnes DWT and 600,000 tonnes storage capacity,
- Potential synergies for the development of marine related industry and renewable energy, with the potential to multi-use the existing infrastructure;
- The strategic importance in respect of security of energy supply;
- Limitations of the current site with expansion requiring the extension of the operational area and potential upgrade of jetty facilities.

Within the SIFP, the broader Shannon Estuary has been identified as an area of opportunity for tidal energy testing due to the presence of deep waters. Areas identified as 'Areas of Opportunity for Tidal Energy' include an area to the south-east of the Moneypoint ESB landholding.

The SIFP sets out Guiding Principles for the development of the SDL, *inter alia*:

- The location is identified for energy uses
- Alternative land use – particularly related industry on the greenfield areas compatible with the primary anticipated use may be acceptable, where they do not compromise the primary use
- The role of ESB Moneypoint is to be safeguarded ensuring that its power generation, transmission capability and distribution functions are protected, as well as those core assets required for their operations – including access to cooling water, marine waters and commercial shipping lane access
- Opportunities associated with the adjacent Area of Opportunity for Tidal Energy is recognised
- All proposals for development should provide a Concept Masterplan which includes:
 - Analysis of location features, opportunity and constraints
 - Explanation of the design, its component parts and how these are compatible and integrate with the location characteristics.
- All development proposals for marine related activity will need to be evaluated to consider combined risks and potential consequences to the environment, given its SEVESO status (subject to the Seveso III Directive 2012/18/EU).

The GA Concept has been strongly influenced by the final report (July 2023) of the independent Shannon Estuary Economic Taskforce, established in April 2022 to create a long-term vision for the estuarine region and to outline a practical action plan to realise it. The final report of the Taskforce (July 2023) was published in the context of:

- CAP23 commitments including the development of at least 7 GW of offshore under by 2030 – with 2 GW allocated for green hydrogen production
- The prevailing security of supply concerns

- The need to achieve significant renewable energy and decarbonisation targets; and
- The European Commission's Green Deal – which sought to accelerate the decarbonisation of the EU energy sector and ensure the Union becomes self-sufficient in energy as soon as possible.

The Taskforce Report concluded that the Shannon Estuary has an opportunity to accommodate one of the world's largest renewable energy hubs, built primarily around the harnessing of global scale offshore wind energy from the Shannon Estuary. It notes that the Estuary is - in an international context, uniquely primed to deliver this, with over 500km² of deep sheltered water facing out into the Atlantic Ocean; proximity to some of the world's best wind resources; natural sheltered waters sufficiently deep to facilitate floating offshore wind installation at scale; and extensive land suitable for industrial development.

The Report envisages the development of an Atlantic Green Digital Corridor – starting in the Estuary and expanding along the entire Wild Atlantic Way. It identifies the potential for the creation of 50,000 high quality, green jobs through the utilisation of wind energy from the Atlantic - 10,000 of which will be delivered by 2035, by which time the Shannon Estuary Region can become carbon neutral. The document refers to the need for priority planning designation and accelerated delivery of strategic infrastructure.

In terms of energy, the GA Concept shows 70 GW of wind is within a 36-hour 'wet-tow' of the Estuary which also has significant potential to accommodate large areas of wet storage. The Report envisages the development of the Estuary as a major receiving node for offshore wind electricity generated off the west coast – through existing grid networks some of which will require enhancement, and the delivery of up to 30GW of Atlantic Offshore Wind through the Estuary by 2050. It sets out measures to maximise the industrial development opportunities arising from this to enhance the quality of life for the current workforce and population in the region.

As set out above, any future application for project development within the Coastal Infrastructure Zone, would be required to demonstrate at the time of submission and in light of the project-specific impacts of the development, that there remains no suitable, less damaging alternative to the project. The final determination of the outcome of such an assessment would need to be informed by the detailed information on the proposed developments impacts upon the European sites, the potential for mitigation of potential impacts and an up-to-date assessment of the potential alternatives.

In light of the above, in addition to further information set out within Section 1 of this NIS, it is considered that specific or detailed consideration of potential alternatives to projects arising from the objectives and principles of the GA Concept is not currently possible. However it is considered that the developments arising from the GA Concept (which does not specify the extent and nature of any particular development) may be sufficiently supported by adequate evidence to support that no satisfactory or less-damaging alternative solutions exist.

7.3 Imperative Reasons of Overriding Public Interest

As per Article 6(4) of the Habitats Directive, in addition to the requirement to evidence a lack of alternative solutions, there is a requirement for development giving rise to adverse effects on the integrity of European sites for the competent authority to demonstrate that the project is necessary for IROPI.

Again, while it is considered that a detailed and accurate assessment of the projects arising as a result of the adoption of the GA Concept is not currently possible, given the lack of detail on the extent and nature of such proposals, it is considered likely that the project-level development of the Coastal Infrastructure Zone may be supported by robust evidence for categorisation as IROPI development. This conclusion is drawn in light of the various national policies identifying the importance of the Shannon Estuary for the future of offshore renewable energy development in Ireland and the identification of Moneypoint as an important strategic location in facilitating this future development.

Where a project arising from the GA Concept is deemed to comprise IROPI development, it is considered that the project will be required to demonstrate that appropriate compensatory measures can be put in place to address the identified adverse effects on integrity arising from the project upon the relevant European sites.

7.4 The Identification of Compensatory Measures

Should the projects arising from the objectives and principles of the GA Concept seek to develop the Coastal Infrastructure Zone it is envisaged that compensatory measures will be required for the loss of Annex I QI habitats which may arise, including reef and estuary habitats.

ESB will seek to engage with the NPWS, as early as possible in the design process of projects proposed for development of the Coastal Infrastructure Zone, to inform the likely extent and nature of compensation required and to assist in the design, where possible.

Guidance published by the European Commission⁴⁵ set out the following in respect of compensation for impacts to estuaries and coastal zones:

“In instances where damaging developments are, in the absence of alternative solutions, to be allowed to proceed there will be a need for compensation measures to fully offset any loss or damage to the site. These should be precisely adapted to the type of impact predicted and should be focused on the coherence of the Natura 2000 network and the particular elements affected at site level. This requires that measures refer to the structural and functional aspects of the site integrity, the related types of habitat and species populations that are affected and the contribution of these elements to the overall coherence of the Natura 2000 network.

Compensatory measures must be feasible and operational in protecting the overall coherence of the Natura 2000 network. The estimated timescale and any maintenance action required to enhance performance should be specified as early as possible in the project. Once the compensation scheme is agreed, the permits granted and a monitoring programme in place, unforeseen uncertainties should in principle not significantly hamper the core of a plan or project. Such possible new uncertainties should, however, trigger targeted investigations and if necessary extended monitoring and adaptive or corrective measures.

‘Losses’ should be quantified with respect to key habitats and species: according to current knowledge and expert judgement. Compensation measures must be designed on the basis of best scientific knowledge and should accomplish the ecological functions necessary to support the affected species and habitats.

Environmental damage/ environmental benefit from compensation ratio should be assessed: there is wide acknowledgement that compensation/ damage ratios should be generally well above 1:1. Thus, compensation ratios of 1:1 or below should only be considered when it is demonstrated that such measures will be 100% effective in restoring good structure and functionality within a short period of time.

Appropriate compensation sites should be selected by considering the following: (a) Compensation within the Natura 2000 site if the necessary elements to ensure ecological coherence and network functionality exist within the site. (b) Compensation outside the Natura 2000 site if the same contribution to the ecological network is feasible. The new location can be another site designated as EC Guidance on the implementation of the EU nature legislation in estuaries and coastal zones 31 Natura 2000 or a non-designated location. In the latter case, the area has to be designated as a Natura 2000 site itself.

The compensatory measures must ensure the continuity of the ecological processes essential for maintaining the overall coherence of the Natura 2000 network. The compensation scheme should be ‘effective’ at the time the negative effects occur on the site concerned. Early implementation is of the essence. The application of specific mitigation measures to overcome possible interim losses may be necessary.

All necessary provisions, technical, legal or financial, necessary to implement the compensatory measures should be completed before implementation of the plan or project starts, so as to prevent any unforeseen delays that may hinder the effectiveness of the measures.

Financing, monitoring and reporting: Compensatory measures imply that a sound legal and financial basis for long-term implementation, protection, monitoring and maintenance be secured in advance.”

⁴⁵ European Commission: Directorate-General for Environment, *Guidelines on the implementation of the birds and habitats directives in estuaries and coastal zones – With particular attention to port development and dredging*, Publications Office, 2012, <https://data.europa.eu/doi/10.2779/44024>

While it is not known whether compensatory measures for the loss of Annex I QI estuary and reef habitat has been proposed and implemented previously in Ireland, it is apparent that a number of schemes which have involved the delivery of compensatory wetland habitat have been delivered within the UK.

The exact extent and nature of compensation required will arise through the design phase of proposed development for within the Coastal Infrastructure Zone.

8. Summary and Conclusion

8.1 Summary

The Screening for AA determined that 30 of the GA Concept objectives and principles guiding development have the potential to result in likely significant effects on European sites within the Zone of Influence of the GA Concept. These were taken forward to AA.

The Source-Pathway-Receptor method was employed to assess whether the implementation of the GA Concept objectives and principles will adversely affect the integrity of the Lower Shannon SAC and River Shannon and River Fergus Estuaries SPA.

- The **Source** of are the 29 objectives and principles taken forward to AA (objective 2, objective 3 objective 4 and principles MEZ1, MEZ3, MEZ4, MEZ6, MEZ7, MEZ9, CIZ1, CIZ2, CIZ3, CIZ5, CIZ6 CIZ7, CIZ8, CIZ9, IEZ1, IEZ2, IEZ3, IEZ5, AMZ4, AMZ6, AMZ7, AMZ8, GDZ1, GDZ3, BZ1, BZ4, TAZ2, WZ2)
- The **Pathways** for effect by which implementation of the GA Concept objectives and principles can impact the relevant QIs of the Lower Shannon SAC and the SCIs of the River Shannon and River Fergus Estuaries SPA are through habitat loss, hydrological connectivity, aerial connectivity and functionally linked land; A range of further more distant European sites were also deemed to within the ZoI of the GA Concept for impacts arising through large-scale oil spill and underwater noise and vibration effects
- The **Receptors** are the QI marine habitats (Estuaries, Reefs and Perennial vegetation of stony banks) and QI species (otter, common bottlenose dolphin, sea lamprey, brook lamprey and Atlantic salmon) of the Lower Shannon SAC and all the SCIs of the River Shannon and River Fergus Estuaries SPA, in addition to a range of marine and coastal Annex I habitats, marine Annex II species and marine SCI bird populations of European sites within the ZoI for large-scale oil spill or QI marine mammal species within the marine mammal management units for marine mammals in respect of underwater noise and vibration effects (as described in Table 2).

The potential for in-combination impacts with other projects and plans have been assessed in Section 4.7.

Mitigation measures, in the form of in-design mitigation contained within the GA Concept and recommended mitigation measures have been provided as part of this AA report. With the implementation of mitigation recommended within this AA, there is sufficient evidence for the AA to conclude that the implementation of the GA Concept would not result in adverse effect on the integrity of the Lower Shannon SAC and the River Shannon and River Fergus SPA through accidental pollution events, habitat fragmentation and degradation, noise, vibration, lighting and human presence and species disturbance, underwater noise and vibration, species mortality, spread of invasive species or temporary species disturbance or displacement. This conclusion is drawn for GA Concept when considered either alone or in-combination with other plans or projects.

The GA Concept and mitigation proposed in this report is directed at a strategic high level and therefore it is considered that it will avoid adverse effects on the integrity of the two European sites, wherever possible, alone or in-combination.

The GA Concept is inclusive of objectives and principles for the potential development of the Coastal Infrastructure Zone, which have potential, at the project level, to give rise to the loss of QI Annex I habitats reef and estuaries of the Lower River Shannon SAC and the associated loss of wetland habitat representative of the SCI wetland and waterbirds of the River Shannon and River Fergus Estuaries SPA.

It is considered therefore that proposals for the development of the Coastal Infrastructure Zone, at the project level, have potential to give rise to adverse effects upon the integrity of the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA through habitat loss. It is envisaged that such proposals would be required to demonstrate that no suitable and less damaging alternatives exist, that the development is necessary for imperative reasons of overriding public interest and that sufficient compensatory measures can be delivered to offset the loss of habitat area.

Given the nature of the Moneypoint site and its strategic value as a potential hub site for offshore renewable energy it is considered that there may be a strong and valid case that these criteria can be met in respect of the proposed development of the Coastal Infrastructure Zone. Further detailed consideration of the exact extent and nature of the project in question will be required in support of any such case for consideration by the Irish Government and the EU Commission.

8.2 Conclusions

In order for the AA to comply with the requirements of Article 6(3) the Habitats Directive, an Appropriate Assessment undertaken by the competent authority must include an examination, analysis, evaluation, findings, conclusions and a final determination. The information in this report will, along with all other submissions and observations received following public consultation, enable ESB Networks to perform its statutory function in this regard.

This AA has examined and analysed, in light of the best scientific knowledge, with respect to the relevant European sites, the sources and pathways for effect, and how these may result in adverse effects on the identified QIs and SCIs and therefore the integrity of European sites.

Mitigation measures are set out within this report to ensure that adverse effects on the integrity of European sites will be avoided wherever possible during the implementation of the GA Concept either alone or in combination with other plans or projects.

There remains the potential for projects arising from the GA Concept objectives and principles within the GA Concept Coastal Infrastructure Zone to give rise to adverse effects on the integrity of the Lower River Shannon SAC and River Shannon and River Fergus Estuaries SPA through habitat loss. In such circumstances it is considered that it will be for project level consideration as to whether such development is proposed in the absence of suitable alternatives, necessary for imperative reasons of overriding public interest and that suitable compensation measures can be delivered to offset any potential impacts. This process will be highly dependent upon the extent and nature of the proposed development at the detailed project stage.

Accordingly, in the professional opinion of the authors of this report, it is considered that potential for the GA Concept to give rise to likely significant effects on European sites has been addressed as far as possible through the implementation of the mitigation measures outlined in this Natura Impact Statement. Where potential for project level adverse effects upon the integrity of European Sites remain further detailed analysis and potentially Article 6(4) assessment may be required.

Appendix A

Impact Assessment of the GA Concept

A.1 Impact Assessment of the GA Concept

Table 6 Impact Assessment of the GA Concept

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
Objective 1	To ensure Moneypoint continues to support economic development and activity in the Shannon Estuary, County Clare, the broader Region and State by providing a reliable source of electricity while ensuring the site is developed and operated to the highest environmental standards, in-line with ESB's Environmental Management Systems,	The objective accounts for the provision of support and long-term planning forward for the economic development of the region whilst maintaining supply of electricity. Future development is not inferred from this objective. No potential impacts anticipated.
Objective 2	To transition the site to a new, lower carbon operating profile, moving progressively towards zero carbon generation with Moneypoint providing dispatchable electricity and energy storage to support an increasingly renewable energy sector	The objective suggests that infrastructure development with the potential of construction may occur as a result of the 'transition' of the site from a fossil fuel based electricity source to a lower carbon operating profile. To facilitate this change it is highly likely that infrastructure will require adaptation, with the potential for new development i.e. suggesting construction on site. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
Objective 3	To develop Moneypoint as a base for the offshore renewable energy sector, acting as a construction and deployment base, and a manufacturing location for zero carbon fuels	The objective suggests that infrastructure development, with ongoing construction and deployment operation for the offshore renewable energy sector will be facilitated onsite at Moneypoint. To facilitate this, it is highly likely that infrastructure will require adaptation, with the potential for new development i.e. suggesting construction on site. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
Objective 4	To develop and operate Moneypoint so it supports Ireland's ambitions to become a net exporter of zero carbon energy.	The objective suggests that infrastructure development, with construction and operation for the offshore renewable energy sector will be facilitated onsite at Moneypoint. To facilitate this, it is highly likely that infrastructure will require adaptation, with the potential for new development i.e. suggesting construction on site. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
MEZ1	<p>ESB will develop these lands for activities relating to marine energy and associated industrial activity.</p> <p>While the primary focus will be on development associated with the construction and operation of the Moneypoint Hub – a strategic base for ORE; such developments may include large-scale energy users that require a location adjacent to estuarine/deep water; have a dependency on marine transport, transshipment, bulk cargo; or where the industrial processes benefit from a location adjacent to the marine area and/or proximity to a major energy generation hub.</p> <p>Development will be phased based on the availability of land, as existing uses e.g. FGD landfill area is remediated. Typical uses will include:</p>	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
	<ul style="list-style-type: none"> • facilities utilising renewable energy in the production of alternative zero-carbon fuels such as hydrogen, ammonia, etc. • construction yard – area for the fabrication and assembly of renewable energy technology infrastructure including fixed and floating foundations, etc. • turbine laydown - storage of turbine elements (blades, nacelle, tower, mooring lines / anchors etc); • turbine assembly and integration – quayside area for the assembly of turbines and their integration on to floating platforms; • ancillary laydown areas and compounds. <p>It is noted that proposals for that facility will incorporate sufficient flexibility in design to future proof the site and ensure it remains a viable base for long-term operations, allowing for increased scale of deployed units etc.</p> <p>The ramp area near the jetty has been identified as vulnerable to coastal inundation. Land uses in this area will be demonstrably 'water compatible' in-line with the relevant Guidelines.</p> <p>Ancillary development may include:</p> <ul style="list-style-type: none"> • supporting infrastructure – including control buildings, materials handling infrastructure such as concrete batching plant etc • operation and maintenance (O & M) functions for the ORE industry • grid support services e.g. BESS units • substation compound to facilitate offshore grid connection • generation facilities – such as those used for emergency generation • areas of external electrical plant (small scale), • storage facilities (open air or enclosed), • lay down areas, car parking etc, and • ancillary industrial activities. 	
MEZ2	<p>All development proposals will have regard to the prevailing land use zoning of the site, and the visual and ecological sensitivity of the adjoining coastline, noting the proximity to a European site. As such, any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA.</p>	<p>The purpose of this objective is to account for the site's sensitivities, it does not strictly suggest development, or when it may occur. Therefore no potential impacts anticipated.</p>
MEZ3	<p>ESB, and third parties including Eirgrid, may develop infrastructure e.g. underground export cables, onshore substation, serving ORE developments such as those ESB propose to develop, in this zone.</p>	<p>It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.</p>
MEZ4	<p>ESB will remediate brownfield lands, including the FGD landfill, in line with environmental licensing requirements and planning consents.</p>	<p>It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.</p>

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
MEZ5	ESB will manage the existing FGD landfill in accordance with the appropriate licences and consents. ESB will investigate the feasibility of developing this area, in scenarios where the landfilled FGD is removed, and where it is not.	The purpose of this objective is to give regard to how the land-use zones within the Moneypoint site will adhere to legislation, licences and consents. No potential impacts anticipated
MEZ6	In-line with the promotion of the circular economy, ESB will seek to realise the commercial value of landfilled FGD located to the east of the station. If feasible this will necessitate the excavation of the material and its export from the site for use or disposal, off-site, subject to consent. Such works would be carried out in-line with Waste Management Regulations.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
MEZ7	Where FGD area exceeds capacity, alternative disposal capacity for FGD waste will be sought in favour of developing Landfill Area B to the west of the existing station.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
MEZ8	Electrical infrastructure will not be located in proximity of the existing wind turbines and the met mast. All other development at these locations will be assessed having regard to the risk of conflicts arising.	The purpose of this objective is to outline parameters relating to the placement of electrical infrastructure. No construction is suggested. No potential impacts anticipated.
MEZ9	ESB will consider the removal or relocation of wind turbines and / or the met mast as necessary, where this would facilitate the broader scale development of the Moneypoint site for purposes associated with marine energy.	This objective outlines the potential for construction in the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in construction. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ1	ESB will seek to develop and enhance coastal infrastructure at the Moneypoint site to facilitate its development as a hub for the ORE industry. It is expected that new infrastructure will be required for the delivery of turbine elements, deployment of substructures, assembly of turbines and limited storage, at the quayside. This may require the removal of the existing jetty and the development of new quayside infrastructure including infilling / land reclamation; and / or the repurposing of the existing jetty and barge landing facility for alternative uses.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ2	All development proposals will be developed having regard to the prevailing land use zoning of the wider site, the over-arching requirement to develop facilities to support the development of at-scale ORE development and the ecological sensitivity of the adjoining Shannon Estuary. Proposals will incorporate sufficient flexibility in design to future proof the site and ensure it remains a viable base for long-term operations. Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA, or that circumstances prevail whereupon consent can be granted having regard to broader considerations.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
CIZ3	ESB will work with other developers and operators in the Shannon Estuary, and wider coastal area, to develop additional support infrastructure including wet storage facilities, to meet the needs of the emerging ORE industry. The design and siting of any development in this zone will take cognisance of the visual and ecological sensitivity of the adjoining coastline, which includes the Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA.	Whilst this objective is objective is regarding the collaboration with Shannon Estuary operators the text of 'to develop additional support infrastructure' suggests construction activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ4	All works will be planned and carried out having regard to the requirements to avoid impacts on the 220kV and 400kV underground cables (UGCs) – with planned re-routing of such services where required.	This objective pertains to electrical supply requirements rather than any construction or operation. No potential impacts anticipated.
CIZ5	Electrical infrastructure will not be located in proximity of the existing wind turbines located in the adjacent Marine Energy Zone. All other development at these locations will be assessed having regard to the risk of impacts arising.	In this objective, the potential for construction is inferred through the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in construction. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ6	ESB will consider the removal or relocation of the wind turbine where such a proposal would facilitate the broader scale development of the site for purposes associated with marine energy.	In this objective, the potential for construction is inferred through the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in construction. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ7	All developments within the maritime area will be assessed to identify - and where possible, mitigate against, impacts on marine archaeology.	This objective pertains to assessment criteria rather than construction or operation. As a result no potential impacts anticipated.
CIZ8	ESB may develop infrastructure serving the ORE developments e.g. underground export cables, substations, in this zone.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
CIZ9	Having regard to broader proposals for the development of additional undersea cables, international interconnectors and two-way gas pipelines within the Shannon Estuary, it is acknowledged that this zone may be developed to accommodate such strategic infrastructure.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
IEZ1	ESB will continue to operate the existing Moneypoint generating station in-line with all consents and licences, supporting the energy security of the Region and the State.	This objective pertains to the current operation and the ESB's commitment to generating in line with all consents and licences. No future construction is anticipated. No potential impacts anticipated.
IEZ2	ESB will develop these lands for activities relating to energy generation and associated industrial activity. Given the strategic importance of Moneypoint as a generation asset, the development of this zone will be phased and Moneypoint 'repowered' with the introduction of energy storage, development of new generation capacity and the introduction of new thermal technologies, to ensure the site continues to support energy security.	This objective suggests phased development which generates the potential for cumulative impacts over time. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
	<p>Ancillary developments in the area may include:</p> <ul style="list-style-type: none"> • supporting infrastructure – including control buildings, materials handling infrastructure such as concrete batching plant etc • energy and fuel storage, • grid support services, • substation compound and areas of external electrical plant • small scale, temporary generation facilities – such as those used for emergency generation • storage facilities (open air or enclosed), • lay down areas, car parking etc. and • ancillary industrial activities. <p>The ramp area near the jetty has been identified as vulnerable to coastal inundation. Land uses in this area will be demonstrably 'water compatible' in-line with the relevant Guidelines.</p>	
IEZ3	ESB will manage and develop this zone to accommodate large-scale electricity generation and all associated above and below ground infrastructure. It is envisaged that, over time, these operations will transition the site to a low- and zero carbon operating profile, in-line with the strategic objectives of ESB.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
IEZ4	ESB will examine the feasibility of repurposing all, or part of, the existing generating station, where such proposals align with ESB's corporate commitments to decarbonise electricity generation activities, in support of national and international targets.	This objective pertains to feasibility studies and proposals. It is not anticipated that construction will be likely as a result of this objective. No potential impacts anticipated.
IEZ5	ESB will seek the wholesale replacement of structures on this site to facilitate the introduction of increasingly lower carbon technology, transitioning over time to alternative low and zero carbon fuels, such as green hydrogen and ammonia, and ensuring Moneypoint continues to operate as a strategic asset in Ireland's energy system.	This objective relates to construction elements regarding the replacement of structures which includes removal and installation with potential for impacts. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
IEZ6	All development proposals will be developed having regard to the prevailing land use zoning of the site, and the visual and ecological sensitivity of the adjoining coastline. Any development in this area will be required to demonstrate that it does not negatively impact on the conservation objectives of the adjoining Lower River Shannon SAC (site code 0002165) and River Shannon and River Fergus Estuaries SPA.	This objective outlines the ESBs position on giving regard to planning policy and ecological sensitivities. No construction is inferred. No potential impacts anticipated.
IEZ7	All works will be planned and carried out having regard to the requirements to avoid impacts on the 220kV and 400kV UGCs and extensive water and drainage networks – with planned re-routing of such services where required.	This objective pertains to electrical supply requirements rather than any construction or operation. No potential impacts anticipated.
AMZ1	ESB will manage this zone in accordance with the appropriate licences and consents.	This objective pertains to ESB's position in managing the AMZ1 in line with the licences and consenting process. Considering that environmental assessments are required under the management of such zones, no potential impacts are anticipated.

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
AMZ2	ESB will continue to utilise the ASA for the storage of ash and/or FGD, seeking revised consents and licences, as required.	This objective sets forward the intention for the ESB to continue their current use of the Ash Management Zone in line with their current consents and licenses, which are in themselves subject to environmental assessment prior to their granting. No potential impacts anticipated.
AMZ3	Where material remains in situ, the existing ASA will be managed, capped, and ultimately decommissioned in-line with the requirements of the Decommissioning Management Plan (DMP) and Closure, Restoration and Aftercare Management Plan (CRAMP).	This objective sets forward the intention for the ESB to continue their current use of the Ash Management Zone in line with their current consents and licenses. The DMP and CRAMP requirements include an environmental assessment which would capture the potential for likely significant effects at project level stage. No potential impacts anticipated.
AMZ4	Where landfilled material is removed, or the site otherwise engineered to accommodate new development, ESB may develop this area to accommodate development ancillary to the primary activities of the main site, such as: <ul style="list-style-type: none"> • generation activity • supporting services and infrastructure – including control buildings, modules etc, • areas of external electrical plant, • storage facilities (open air or enclosed), • lay down areas, car parking etc. 	This objective relates to construction elements regarding the replacement of structures which includes removal and installation with potential for impacts. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
AMZ5	Any new development within this zone will be subject of robust environmental assessment to confirm that it does not impact on the on-going management of the capped landfill. Specifically, a detailed Hydrogeological Risk Assessment will be prepared and a construction methodology submitted to the EPA for approval, in advance of works being permitted or commenced.	This objective sets forward the intention for the ESB to conduct environmental assessment for any future developments and to seek to avoid any impacts on the capped landfill. No potential impacts are anticipated from this objective.
AMZ6	ESB will seek to realise the re-use of the landfilled material at the ASA and to remediate this part of the site rendering it suitable for new development. If feasible, this will necessitate the excavation of the material and its export from the site for use or disposal, off-site, subject to consent. Such works would be carried out in-line with Waste Management Regulations.	For this objective, the reuse of any landfilled material shall be subject to licensing and consenting procedures which would include consideration of environmental and ecological factors. The potential for any likely significant effects shall be captured at project level stage. No potential impacts anticipated arising from this objective.
AMZ7	Where new development is located on the ASA lands, the scale of new development will be appropriate to the location and setting. The transition between any new development and adjoining agricultural areas; will be managed and the sensitivity of views from the N67 and the coast considered in project design. Screen planting will be incorporated into development proposals, as appropriate.	This objective pertains to considerations that will be made during project level stage. The consideration of appropriate design of new development that considers the landscape and visual aspects is key to the objective. No potential impacts anticipated.
AMZ8	Electrical infrastructure will not be located in proximity of the existing wind turbine. All other development at these locations will be assessed having regard to the risk of impacts arising.	In this objective, the potential for construction is inferred through the removal or relocation of infrastructure. Due to ambiguity of wording, the outcome of this principle could result in construction. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
AMZ9	ESB will consider the removal or relocation of the wind turbine where such a proposal would facilitate the broader scale development of the site for purposes associated with marine energy	In this objective, the potential for decommissioning and construction is inferred through the removal of infrastructure, and potential new projects. Due to ambiguity of wording, the outcome of this principle could result in construction. As it is difficult to establish how much construction will be required through the wording of this

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
		objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
GDZ1	<p>These lands lie outside the engineered ASA. ESB may develop these to accommodate relatively small-scale development ancillary to the primary activities of the main site, such as:</p> <p>supporting services and infrastructure – including control buildings, modules etc,</p> <ul style="list-style-type: none"> • areas of external electrical plant, • storage facilities (open air or enclosed), • lay down areas, car parking etc. 	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
GDZ2	The scale of any new development will be appropriate to the location and setting. The transition between any new development and adjoining agricultural areas; will be managed and the sensitivity of views from the N67 considered in project design. Screen planting will be incorporated into development proposals, as appropriate.	This objective pertains to considerations that will be made during project level stage. The consideration of appropriate design of new development that considers the landscape and visual aspects is key to the objective. No potential impacts anticipated. .
GDZ3	ESB may develop infrastructure e.g. underground cables, substations, serving the ORE developments in this zone.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
BZ1	These lands will accommodate small-scale, low-level development to ensure they do not have a disproportionate visual impact on adjoining agricultural lands and the adjoining coastal zone.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
BZ2	<p>New development within the buffer zone around the ASA will be sited having regard to the ecological value of the dense oak-dominated immature woodland located to the north of the ASA.</p> <p>The coastal side of the buffer area (and adjacent section of the N67) has been identified as being potentially vulnerable to coastal inundation. Land uses in this area will be demonstrably ‘less vulnerable’ or ‘water compatible’ in-line with the relevant Guidelines.</p>	The purpose of this objective is to account for the site’s sensitivities, it does not strictly suggest development, or when it may occur. Therefore no potential impacts anticipated.
BZ3	The protected earthwork to the north of the ASA will be protected in situ. Development will generally not be located within 30m of that feature. A suitably qualified archaeologist will be engaged to assess the impact of any works in this area on that monument. It is understood that it may be permissible to install underground services e.g. cables, in this area where it can be demonstrated that there works will have no direct impact on the monument.	This objective outlines protective measures towards features on-site. It does not pertain to construction, rather preventative measures to ensure no impacts in the future. No potential impacts anticipated.
BZ4	ESB may develop infrastructure serving ORE developments - e.g. underground export cables, substations, in this zone.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all

Objective/ Principle	Principles Guiding Development	Rationale for Impact Assessment
		potential impacts as a result of construction must be considered.
TAZ1	ESB recognises the importance of Moneypoint as a strategic node in the transmission network. These lands will be maintained to enhance transmission infrastructure.	Within this objective, there is no new development proposed within this principle. New development is proposed in principle TAZ2. No potential impacts anticipated.
TAZ2	ESB may develop infrastructure e.g. underground export cable, substation, serving the ORE developments such as Moneypoint 1 and 2 Offshore Wind, in this zone.	It is highly likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.
SZ1	This site accommodates existing and proposed strategic cables. The route of these cables will be maintained, as required.	This objective pertains to maintenance of existing infrastructure. No new construction is suggested. No potential impacts anticipated.
SZ2	Existing berms provide screening between the coal storage area and adjoining agricultural lands – noting the significant change in levels due to the excavations undertaken to create the coal storage area. These will be retained and incorporated into future layouts to manage interactions between the site and adjoining land users.	This objective pertains to existing structure and relevance to landscape and visual impacts. No potential impacts anticipated.
WZ1	The protected mature woodland will be maintained free from development to ensure it is retained as a visual and ecological asset on the site.	The purpose of this objective is to account for the site's sensitivities, it does not strictly suggest development, or when it may occur. Therefore no potential impacts anticipated.
WZ2	The remaining lands immediately south of the N67 may accommodate small scale development, where they demonstrably do not impact on the ecological integrity of the woodland or the visual amenity of the N67.	It is likely that the objective will result in construction and operation activities. As it is difficult to establish how much construction will be required through the wording of this objective, on a precautionary basis, all potential impacts as a result of construction must be considered.

A.2 Identified Impacts of the GA Concept

Table 7 Potential impacts identified per principle as a result of the implementation of the GA Concept in the absence of mitigation.

Objectives or Principles	Accidental Pollution	Habitat fragmentation or degradation	Habitat loss	Aerial noise, vibration, light and human presence related habitat and species disturbance	Underwater Noise and Vibration	Surface water run off/dust carrying suspended silt or contaminants to the marine environment	Temporary species disturbance/displacement	Spread of Invasive Species	Species Mortality

Statement of Competency

C.1 Statement of Competency

The statements of competencies for the contributing authors to this AA report are provided below:

Donncha Madden has a BSc in Applied Ecology and a PGEDip in Restoration Ecology and is a Chartered Ecologist and Full Member of CIEEM. Donncha has over 20 years' experience in the environment and ecology sector and has prepared numerous AA Screening and full AA reports for a variety of plans and projects in both Ireland and the UK.

Samuel O'Hara has a BSc (Hons) in Ecology and is a full member of CIEEM. Samuel has ten years of experience working as an ecological consultant in public and private sectors and has prepared Screening for AAs, Natura Impact Statements/Reports and biodiversity chapters for EIARs across a large number of projects and plans in the Republic of Ireland and Northern Ireland.

Hannah Sheridan has a BSc (Hons) in Marine Science and an MSc in Marine Planning for Sustainable Development and is a Qualifying Member of CIEEM. Hannah has four years of experience working as an ecologist in public and private sectors and has prepared Screening for AAs, Natura Impact Statements/Reports and biodiversity chapters for EIARs across a number of projects and plans in the Republic of Ireland and Northern Ireland.

Appendix D

Public Consultation Submissions & responses

D.1 Public Consultation Submissions & Responses

Organisation/ Individual	Consultation feedback	AA Response
DAERA	<p>Natural Environment Division Comments:</p> <p>NIEA Natural Environment Division works to ensure that Northern Ireland’s special natural environment, including its flora, fauna, and landscapes, is conserved, enhanced and managed for the benefit of this and future generations, thereby contributing to sustainable development.</p> <p>NED notes the significant distance between the location of the site in which the strategy covers at Moneypoint Co. Clare and Northern Ireland. NED also notes comments made with Section 5.10 that “No Direct transboundary environmental effects are anticipated as a result of the implementation of the GA Concept” and that there is the potential for indirect positive transboundary effects. NED is content on this basis. NED also notes the comments made in response to the DAERA scoping response within Section A.3 and is content on this basis.</p> <p>Natura Impact Statement (NIS)</p> <p>NED has reviewed the NIS report and is content with the findings of said report. NED notes that potential impacts have been mitigated as outlined within section 6 of the report. NED advises that DAERA should be reconsulted if there are any changes which result in impacts on Northern Irish sites.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>Marine and Fisheries Division Comments:</p> <p>We welcome wave and elevation methodologies and modelling applied in the Strategic Flood Risk Assessment (SFRA), which can inform coastal resilience assessments and Coastal infrastructure planning in NI.</p> <p>We welcome the environmental integration of biodiversity, climate, and heritage applied in the SEA and Natura Impact Statement (NIS)</p> <p>To note that proposed mitigation measures and strategies for cross border/mobile species (e.g., cetaceans) (e.g., Noise and habitat disturbance mitigation measures, NPWS guidelines, acoustic thresholds) are directly relevant and applicable to NI, particularly offshore renewable energy sector and port developments. Equally, cumulative impacts across Irish Sea and Atlantic zones should be considered.</p> <p>Functional linkage assessments for migratory species and marine mammals offer a model for NI’s HRA processes.</p> <p>We welcome the consideration for transboundary effects in the SEA.</p> <p>We welcome the Environmental Sensitivity Mapping included in the SEA. This is a valuable tool for NI’s coastal zone management.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

EPA	<p>Compliance with Industrial Emissions Licence conditions</p> <p>We acknowledge that the ESB, through the Strategy, intends for Moneypoint to continue playing a key strategic role in supporting Ireland’s transition to a low carbon economy and society. In developing and implementing the Strategy, the ESB must ensure that the conditions set down in the Industrial Emissions licence (PO605-04), and the associated Closure Restoration and Aftercare Management Plan are adhered to.</p> <p>Regarding licencing considerations, the EPA invites the ESB to consult early on any new activities that might require an EPA licence prior to operation commencing. Pre-application meetings are encouraged and can be arranged. 2 EPA recommends that SEA-related monitoring and monitoring associated with the EPA licence are separated out into distinct subsections, rather than compiling in one table in the SEA. This will help distinguish the different monitoring requirements of both Strategy and the licence.</p>	This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary
	<p>Integration of environmental considerations</p> <p>We welcome the extent to which the environmental assessments (SEA, AA and SFRA) have been integrated into and informed the Strategy. This reflects a good example of application of good SEA practice. We also acknowledge that the Strategy includes ‘Overarching Principles’ which have a strong environmental component to be considered for individual projects arising out of the Strategy. These principles have also been informed by the SEA recommendations and the other environmental assessments.</p> <p>The Strategy comprises specific zones (marine energy zone, coastal infrastructure zone, industrial energy zone, ash management zone, general development zone, buffer zone, transmission asset zone, screening zone, and a woodland zone) for development. The Strategy describes the environmental considerations and sensitivity of the surrounding area and incorporates the recommended mitigation measures from the SEA and other environmental assessment processes as appendices. By integrating the SEA ER findings and recommendations into the Plan, this maximises the potential for overall positive environmental outcomes. We acknowledge the inclusion of the SEA mitigation measures in the Plan in the appendices.</p>	This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary
	<p>Monitoring</p> <p>The Monitoring Programme should be flexible to take account of specific environmental issues and unforeseen adverse impacts should they arise. It should consider and address the possibility of cumulative effects. Monitoring of both positive and negative effects should be considered. If monitoring identifies adverse impacts during the implementation of the Strategy, the ESB should ensure that suitable and effective remedial action is taken. We acknowledge the reference to the EPA’s Guidance on SEA Statements and Monitoring (2023), which has informed the SEA monitoring programme. This guidance should be a useful resource in implementing the monitoring programme over its lifetime.</p>	This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary

	<p>Appendix I – Comments on the Plan</p> <p>We acknowledge that that Strategy is expected to be fully implemented over a 15-to-20- year timeframe. We also note that development of the Strategy will be on a phased basis and subject to a series of planning and environmental consents. Developing the Strategy on a phased basis will help ensure that an evolving environmental baseline, and ongoing environmental monitoring can be considered over the lifetime of the Strategy.</p> <p>Regarding ‘the Moneypoint Hub project,’ the Strategy acknowledges that ‘limited wet storage of units’ (referring to renewable energy infrastructure) would be facilitated close to the port, but a dedicated wet storage facility would not be accommodated within the Strategy area. It would be useful to clarify which competent authority would be responsible for developing this element. The siting and location of this facility would need to consider its own environmental assessment and planning processes. The potential for cumulative effects (both terrestrial and marine) arising from development and operation of this facility should also be taken into account.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
--	--	---

	<p>Appendix II – Comments on the SEA</p> <p>The SEA Regulations set out the information to be contained in an Environmental Report.</p> <p>We acknowledge, in Section 8.3 Principal Environmental Effects, that drafts of the SEA have informed preparing the Strategy from the outset. This shows that good SEA practice has been applied early-on. We welcome that a list of ‘Overarching Principles’ (arising from the SEA, AA and SFRA assessment processes) was developed and incorporated into the Strategy.</p> <p>Climate Change considerations</p> <p>In Section 5.6.3 Climate, we suggest reference could be made to Ireland’s Climate Change Assessment and the National Climate Change Risk Assessment reports. These would be important resources relating to climate change baseline, mitigation, adaptation, resilience, and risk assessment.</p> <p>Landscape Considerations</p> <p>The Strategy could consider the EPA’s Good practice guidance on SEA and landscape (EPA, 2023). Additionally, the EPA Research Project, Research Report 461: Reframe Landscape Character Assessment looked at informing how landscape character assessments are carried out. A toolkit was developed to assist practitioners carry out landscape character assessments, which may also to inform developing the elements of the Strategy.</p> <p>Radon considerations</p> <p>It would be useful to consider relevant available radon mapping information in the development of the Strategy over its lifetime.</p> <p>Monitoring</p> <p>The monitoring for the SEA is set out in Table 9.3 –Proposed monitoring measures for the GA Concept is noted. The specific type of monitoring information used to inform the Draft SEA indicators should be clarified in the monitoring programme, once established. For example, in monitoring Strategy-related climatic factors, it may be useful if monitoring carbon intensity of the energy produced, or levels of the contribution of Moneypoint to the national energy mix were included. Additionally, we suggest that there is merit in reviewing the National Climate Action Plan to identify any relevant aspects or relevance to inform SEA-monitoring. Similarly, reviewing the relevant National Planning Framework National Policy Objectives, may also help inform the monitoring programme. We welcome the reference to the SEA guidance on SEA Statements and Monitoring (EPA, 2020); however, the 2023 version of this guidance should be referred to. It is available at: https://www.epa.ie/publications/monitoring--</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
--	--	---

	assessment/assessment/strategicenvironmental-assessment/06695-EPA-SEA-Statements-and-Monitoring-Report.pdf	
	<p>Future Amendments to the Strategy</p> <p>You should screen any future amendments to the Strategy for potential for likely significant effects, using the same method of assessment applied in the “environmental assessment” of the Strategy.</p>	This submission is noted. Where there are proposed alterations to the Strategy, where these are material in nature, these alone, would be required to undergo Screening for AA.
	<p>SEA Statement – “Information on the Decision”</p> <p>Once the Strategy is adopted, you should prepare an SEA Statement that summarises:</p> <p>How environmental considerations have been integrated into the Strategy;</p> <p>How the Environmental Report, submissions, observations and consultations have been taken into account during the preparation of the Strategy;</p> <p>The reasons for choosing the Strategy adopted in the light of other reasonable alternatives dealt with; and,</p> <p>The measures decided upon to monitor the significant environmental effects of implementation of the Strategy.</p> <p>You should send a copy of the SEA Statement with the above information to any environmental authority consulted during the SEA process. Guidance on preparing SEA Statements is available at https://www.epa.ie/publications/monitoring--assessment/assessment/strategicenvironmental-assessment/guidance-on-sea-statements-and-monitoring.ph</p>	Official response: This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary
	<p>Environmental Authorities</p> <p>Under the SEA Regulations, you should consult with:</p> <p>Environmental Protection Agency;</p> <p>Minister for Housing, Local Government and Heritage;</p> <p>Minister for Climate, Energy and the Environment; and,</p> <p>Minister for Agriculture, Food, and the Marine</p>	This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary
Aisling Horgan	The report is very focused on Moneypoint but what about the impact of the development on local farmers and the neighbouring towns and villages? This development needs to work with the local community, develop long term sustainable jobs via retraining and promote sustainable energy use by encouraging locals to install solar etc in their homes. This report is very singular and all about ESB but without people and accommodation and supporting infrastructure it won't work. Also there is no mention of any existing local companies, community groups that can be liaised with. For example, the Irish Whale and Dolphin Association. Without local support there will be objections which will cause delays to this much needed development.	This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary

DAFM	<p>It is essential that the sea-fishing and aquaculture sectors are fully recognised and given a high priority as a long-standing, pre-existing, and traditional activity in the marine environment as the proposed development of the Green Atlantic @ Moneypoint Concept 2025 is being evaluated. Fishers and aquaculture site holders are primary food producers dependent upon certain marine areas which are particularly important for food production. This primary production is critical to supplying the downstream indigenous seafood processing and export industries and in sustaining the livelihoods of coastal communities. The importance of these primary and secondary food production activities are reflected in the Government's Food Vision 2030 policy.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>To inform the DAFM comments, the observations of the Marine Institute (MI), Bord Iascaigh Mhara (BIM) and the Marine Engineering Division (MED) on the application were requested.</p> <p>The MI observed that the proposal for Moneypoint does not mention or consider marine fishing or aquaculture activities in the Shannon estuary close to the project site but acknowledge that operational information on Inshore fishing at this resolution is not always available and landings from this area cannot be quantified.</p> <p>MI advise there are pot fishing activities on the southern shore of the estuary, crustacean trap fisheries and aquaculture licence sites that are in proximity to the project area.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

	<p>The MI highlights the proximity of the site to the nearby estuary in the draft Green Atlantic @ Moneypoint Concept: “The adjacent surface water body, the Lower Shannon Estuary is considered to be the sensitive receptor in the event of an unconfined or uncontrolled loss of a contaminant or hazardous material at Moneypoint. The site is adjacent to the Lower River Shannon SAC (Code 002165) and River Shannon and Fergus Estuary SPA (Code 004077) at this location.”</p> <p>MED also noted that the documentation does not provide any detail of marine fishing or aquaculture activities within the Shannon estuary and draw attention to number of licenced aquaculture sites for oysters and mussels.</p> <p>These aquaculture sites lie within the Designated Shellfish Waters of West Shannon Ballylongford on the south shore of the Shannon Estuary to the southwest of Moneypoint.</p> <p>The Oyster Fishery Order T08-004B for European Flat Oyster is located to the west of the Moneypoint, and a small section directly overlaps the pier structures at Moneypoint.</p> <p>Further information on the location of aquaculture sites in the area are available on the Public Aquaculture Viewer by way of the following link: https://dafm-maps.marine.ie/aquaculture-viewer/.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>MED note the Moneypoint facility has been operational for many years with no reported impacts on aquaculture in the Shannon Estuary and recommend that any proposals for development in the area includes an assessment on impacts on aquaculture in Shannon Estuary adjacent to the facility.</p> <p>The evaluation of potential impacts of the ‘Green Atlantic @ Moneypoint’ concept on commercial sea fishing activities needs to be given consideration within the context of the requirements set out under the Maritime Area Planning Act and the National Marine Planning Framework. (NMPF). The principles in the NMPF of avoiding, minimising, or mitigating impacts on access to existing activities (including specific policies on Fisheries and Aquaculture) should be followed and any proposed development activity should incorporate the principle of maximising coexistence with established activities in marine areas.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>DAFM would seek confirmation that where there are any indirect impacts on traditional fishing grounds identified, consultation with local stakeholders will be undertaken prior to and throughout the works and a Fisheries Liaison Officer (FLO) will be appointed to liaise with all the relevant sea going and foreshore users in advance of any marine survey operations.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

Marine Institute (MI)	<p>Summary</p> <p>The “Green Atlantic @ Moneypoint Concept 2025” is a plan intended to repurpose the Moneypoint generating station site in County Clare into a renewable energy hub and strategic resource for the Offshore Renewable Energy (ORE) sector, while maintaining and operating the site as a station. This review considers elements pertinent to fisheries and aquaculture.</p> <p>The plan recognises that: “The adjacent surface water body, the Lower Shannon Estuary is considered to be the sensitive receptor in the event of an unconfined or uncontrolled loss of a contaminant or hazardous material at Moneypoint. The site is adjacent to the Lower River Shannon SAC (Code 002165) and River Shannon and Fergus Estuary SPA (Code 004077) at this location.”</p> <p>Commercial potting fisheries have been recorded operating in close proximity to the site (map below).</p> <p>Aquaculture licenses are coincidentally with the site’s shoreline and in close proximity (map below).</p> <p>Normal operations of the Moneypoint facility or those envisaged in the future, are not expected to adversely impact these fishing and aquaculture activities.</p> <p>Neither fishing or aquaculture activities are considered or reviewed in the currently available documentation.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>Background Request: The Marine Climate Unit has become aware of the below request for observations in relation to the Green Atlantic @ Moneypoint Concept 2025 plan. The consultation documents can be accessed via this link: Generation and Trading We would be very grateful for any observations you may have, Nil or otherwise by Friday the 8th of August to allow us to collate responses and have cleared. Please make use of the voting buttons in this email if convenient.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

	<p>Observations</p> <p>Documents available presently include:</p> <p>Concept Document</p> <p>Draft for Public Consultation, July 2025</p> <p>Natura Impact Statement, 30 June 2025</p> <p>Strategic Environmental Assessment (SEA) Environmental Report, 30 June 2025</p> <p>Strategic Flood Risk Assessment, 30 June 2025</p> <p>These documents do not mention or consider marine fishing or aquaculture activities in the Shannon estuary close to the Moneypoint site.</p> <p>Pot fishing activities have been mapped close by, on the southern shore of the estuary from Moneypoint, fishing for shrimp and potentially other species.</p> <p>While noting that the geographic files indicated below are in the order of 10 years old, Crustacean trap fisheries are still active in the estuary. Operational information on Inshore fishing at this resolution is not always available and we cannot quantify landings local landings from this area or therefore quantify effects.</p> <p>Aquaculture licence sites adjoin the Moneypoint site for European flat oysters while other licenced aquaculture sites are in close proximity.</p> <p>A fishery order (legacy legislation from 1959 Fisheries Act) for production of oysters occurs in the area with two large fishery orders in the bay for flat oysters, a mussel farm across the bay and a few pacific oysters' farms in the area.</p> <p>Ireland's Marine Atlas (https://atlas.marine.ie)</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
--	---	---

DHLGH	<p>nt welcomes the opportunity to comment on the Draft Green Atlantic @</p> <p>Moneypoint Concept 2025 and the supporting SEA Environmental Report. The Department advises that you have regard to the following in finalising both documents.</p> <p>While accepting that the Moneypoint site is largely a brownfield site, the Department advises that the characterisation of the Cultural Heritage baseline of the ESB lands, as summarised at Section 2.5.7, is somewhat understated. The extent of the lands in ownership—as defined in Figure 4—includes the location of a Recorded Monument, CL067-035---- (Earthwork) and the fields immediately bordering the ESB lands include a number of other Recorded Monuments. All of these Recorded Monuments, both within and outside the ESB lands, are subject to statutory protection in the Record of Monuments and Places, established under Section 12 of the National Monuments Act 1930–2014. These sites may be vulnerable to both direct and indirect impacts (including impacts to setting and amenity) from any proposed developments within the ESB lands. Further, the ESB lands include a substantial section of foreshore, with the potential presence of underwater cultural heritage sites, which may also be vulnerable to both direct and indirect impacts from any proposed development.</p> <p>In this regard, the Department is concerned that the list of overarching principles (OPs) at Section 3.4.1 does not make an explicit commitment to ensure the protection of archaeological and cultural heritage (both terrestrial and underwater) and to avoid significant adverse effects, both direct and indirect. While the Department notes that the principles guiding development at Section 3.5 do contain commitments to carry out archaeological impact assessments and underwater archaeological impact assessments, these are too narrowly focused on particular zones only.</p> <p>The Department advises there should be an additional OP committing to the protection of archaeological and cultural heritage (both terrestrial and underwater) and the carrying out of advance Cultural Heritage Impact Assessments, including appropriate underwater and terrestrial archaeological impact assessments in advance of any and all developments.</p> <p>Further, this OP should commit to carrying out any development projects in alignment with the existing Code of Practice between the Department of the Environment, Heritage and Local Government and ESB Networks (2009), or any future revisions to that Code of Practice (see also: https://www.archaeology.ie/advice-and-support/planning-and-guidance/codes-of-practice/).</p> <p>The Department notes that the Strategic Environmental Assessment (SEA) Environmental Report sets out that adherence to the Code of Practice will be a key mechanism for achieving the avoidance of significant adverse effects to archaeology and cultural heritage (see page 59). Therefore, to ensure this outcome, this commitment must also be included within the Concept 2025 draft.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
-------	---	---

	<p>Underwater Archaeology</p> <p>It is noted that the extent of the lands in ownership—as defined in Draft Green Atlantic @ Moneypoint Concept 2025 Figure 4—includes a substantial area of foreshore with known and potential underwater cultural heritage, which has been the subject of prior geophysical survey and underwater archaeological assessment (Archaeological Assessment of Marine Geophysical Datasets: Moneypoint Hub, Co. Clare, Interim Report by Dr Conn Herriott, Archaeological Management Solutions (December 2024)). Section 3 of the National Monuments (Amendment) Act 1987 is the primary piece of legislation for the protection of wrecks over 100 years old and archaeological objects underwater, irrespective of age. Wrecks that are less than 100 years old and archaeological objects underwater or the potential location of such a wreck or archaeological object, can also be protected under Section 3 of the 1987 (Amendment) Act. It should be noted that the Frameworks and Principles for the Protection of the Archaeological Heritage (Department of Arts, Heritage and the Gaeltacht and the Islands 1999, see Sections 3.6.1(3) and 3.6.4) sets out national policy on the protection of the archaeological heritage in the course of development. It includes emphasis on the non-renewable nature of the archaeological heritage, the need to always consider its preservation in-situ as the first option and also the need to carry out appropriate levels and forms of archaeological assessment in advance of development:</p> <p>‘There should always be a presumption in favour of avoiding developmental impacts on the archaeological heritage. Preservation in situ must always be the first option to be considered rather than preservation by record in order to allow development to proceed, and preservation in-situ must also be presumed to be the preferred option’ (Section 3.4).</p> <p>Similarly, the National Planning Framework First Revision (April 2025) states that ‘the protection of archaeological heritage is recognised as a core component to achieving sustainable development’.</p> <p>Accordingly, it is recommended that the overarching principles include the following:</p> <p>The carrying out of advance Underwater Archaeological Impact Assessment to inform development designs and facilitate assessment and formulation of appropriate mitigation strategies for any likely significant effects on underwater cultural heritage.</p> <p>Alignment of any development projects with the existing Code of Practice between the Department of the Environment, Heritage and Local Government and ESB Networks (2009) or any future revisions to that Code of Practice (see also: https://www.archaeology.ie/advice-and-support/planning-and-guidance/codes-ofpractice/).</p> <p>Should you require any further information or clarification on any of the above submission, please do not hesitate to contact the Department.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
--	---	---

	<p>Nature Conservation</p> <p>These observations are intended to assist in relation to identifying potential impacts on European sites, other nature conservation sites, and biodiversity and environmental protection in general, in the context of the current proposal.</p> <p>The Draft Green Atlantic (GA) Concept aims to transition Moneypoint from a coal-fired energy generation plant to renewable energy, with the draft principles guiding development, identifying elements of particular construction activities. These include the construction of infrastructure, structure replacement, Offshore Renewable Energy related infrastructure, the development and enhancement of coastal infrastructure and changes in land use. A number of objectives and principles within the GA Concept relating to the development of the Coastal Infrastructure Zone are likely to give rise to the loss of areas of estuarine habitat located adjacent to and within the Lower River Shannon Special Area of Conservation (SAC) and the River Shannon and River Fergus Estuaries Special Protection Area (SPA).</p> <p>The Natura Impact Statement outlines that direct land-take within the Lower River Shannon SAC boundary may arise as a result of the proposed principles for the development of the Coastal Infrastructure Zone. The Annex I habitats ‘perennial vegetation of stony banks’ and ‘reefs and estuaries’ are recorded in this area. The Conservation Objectives (COs) for the Annex I habitat of ‘perennial vegetation of stony banks’ stipulate that the area of this habitat should remain stable or exhibit an increasing trend. Furthermore, the distribution of this habitat should not undergo any decline or alteration. The physical structure, along with the structure and composition of the vegetation, should be preserved. Similarly, for ‘reefs and estuaries,’ habitat area and community distribution should not decline and in particular for reefs, its habitat distribution should remain stable. Owing to the potential for construction in the zones adjacent to these habitats, indirect and direct loss of Annex I Qualifying Interests habitat cannot be ruled out. Such effects would be considered likely to represent an adverse effect upon the integrity of the site.</p> <p>Similarly for the River Fergus Estuaries SPA, loss of areas of estuarine habitat within the SPA boundary is likely to comprise wetlands, inclusive of the Special Conservation Interest ‘wetlands and waterbirds. The loss of these areas of habitat may represent an adverse effect upon the integrity of the site.</p> <p>The Department acknowledges that, given the nature of the high-level plan document, identification of project specific mitigation measures is not always possible, given the lack of detail on the extent and nature of development. However, the Department is satisfied with the commitment that suitable mitigation measures will be developed at the project level stage to avoid or reduce potential adverse effects on the COs of the habitats/species once the details of the type of development and the level of construction works and impacts are known. More importantly, where mitigation is not possible, for example in the case of habitat loss effects arising from development of the Coastal Infrastructure Zone, there may be a requirement for the project to be considered in respect of Article 6(4) of the Habitats Directive. In this event, the Department will be available for extensive consultation to navigate this process.</p>	<p>The Draft Green Atlantic at Moneypoint is a high-level strategic document that outlines potential future plans for Moneypoint. While the Strategy identifies areas for possible development, it does not provide detailed project-level information regarding the nature, scale, or location of specific works. It is acknowledged that potential impacts on European sites, including the Lower River Shannon SAC and the River Shannon and River Fergus Estuaries SPA, and associated Annex I habitats and Special Conservation Interests, may arise from future development. However, given the absence of detailed construction and operation related information, it is not appropriate at this high level stage to identify or recommend specific mitigation measures within the context of this Strategy. Upon assessment at a project-level, appropriate mitigation measures will be developed at the project level once detailed design and construction methodologies are known. Where adverse effects on site integrity cannot be avoided, consideration under Article 6(4) of the Habitats Directive may be required, and continued engagement with the Department will be essential to navigate this process. In summary, the Strategy serves as a framework for future development rather than a project-level plan. While potential risks to European sites are acknowledged, further assessment and mitigation will be addressed at subsequent stages when sufficient detail becomes available. No modifications to the NIS are considered necessary.</p>
--	---	--

	<p>Competent national authorities are to authorise activity only if they have made certain that it will not adversely affect the integrity of a European site and consequently, not be likely to give rise to deterioration or significant disturbances within the meaning of Article 6(2).</p>	
	<p>The above observations/recommendations are based on the papers submitted to this Department on a pre-planning basis and are made without prejudice to any observations that the Minister may make in the context of any consultation arising on foot of any development application referred to the Minister, by the planning authority/authorities, in his/her role as statutory consultee under the Planning and Development Act, 2000, as amended.</p> <p>You are requested to send any further communications to this Department's Development Applications Unit (DAU) at: manager.dau@npws.gov.ie, or to the following address: The Manager Development Applications Unit (DAU) Government Offices Newtown Road Wexford Y35 AP90</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
Clare County Council	<p>On behalf of Clare County Council, I welcome this opportunity to input into the development of the ambitious plans for Green Atlantic @ Moneypoint in line with the company's "Net Zero by 2040" strategy together with the Governments commitments in the Climate Action Plan 2025 to transition to climate neutrality. As a Local Authority we fully support this ambition and the importance of transitioning our electricity supply to achieve a carbon neutral economy by 2050.</p> <p>Clare County Council welcomes the preparation of this Draft Concept Document which clearly sets out and defines the five core elements of the Green Atlantic @ Moneypoint Concept together with the associated Overarching Principles which will be applied to each. The Planning Department of Clare County Council acknowledges the national strategic importance of Moneypoint to energy security and supply together with its very significant importance to our county in terms of Economic Development.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

	<p>Further to your presentation on the 30th of July 2025 it is important to highlight the Planning context within which the individual Green Atlantic projects sit and the overarching policies and objectives which should be outlined in the Concept document. While we note some of this is outlined in the SEA Environmental Report it is important that the policy document highlights the key planning policies and</p> <p>context which provide the support and technical guidance for the development of this site within the planning hierarchy both from a terrestrial and maritime perspective.</p> <p>Regional Spatial and Economic Strategy for the Southern Region</p> <ul style="list-style-type: none"> • Promoting the conversion of Moneypoint electricity station by 2025 from burning fossil fuels. The RSES recognises the importance of Moneypoint as producer of 25% of national energy and its potential as a deep-water port; • There is significant opportunities to grow the Blue Economy through offshore wave and wind renewable energy in the Shannon Estuary and the west coast of County Clare, reflecting the key natural assets of wave and wind energy, together with the presence of grid connections <p>Regional Policy Objective 79 (a)</p> <p>The RSES recognises the national and international importance of the Shannon Estuary, its potential to attract multinational development and the significant work that has been undertaken to progress its promotion and development. It is an objective to support and promote the delivery of the Strategic Development Locations as set out in the SIFP for the Shannon Estuary subject to the implementation of mitigation measures outlined in the SEA and AA undertaken on SIFP and zoned in the Local Authority Development Plans.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
--	--	---

	<p>Clare County Development Plan 2023-2029</p> <p>The Clare County Development Plan 2023-2029, which was prepared in accordance with the requirements of the Planning and Development Act, 2000 (as amended), the Planning and Development (Strategic Environmental Assessment) Regulations 2004 (as amended 2011) and Article 6(3) of the Habitats Directive, sets out an overall strategy for the proper planning and sustainable development of the functional area of Clare County Council.</p> <p>The Plan takes into account the National Planning Framework (NPF) and the Regional Spatial and Economic Strategy for the Southern Region (RSES), planning guidelines, strategies and policy documents together with the key objectives arising from the Marine Strategy Framework Directive. In the preparation of the final Concept Document, you are advised to have regard to the content of the Plan to ensure compliance with same. Specifically, you are advised to have regard to Volume 9 – Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary and the Development Plan objectives listed below. The list of objectives sets out some of the main considerations from the Plan which are of relevance to the current proposal.</p> <ul style="list-style-type: none"> • CDP 2.14 Transition to a Low Carbon Economy and Society • CDP 6.10 Shannon Estuary • CDP 6.17 Energy Supply • CDP 6.18 Green Technology • CDP 8.8 Natural Resources • CDP 8.12Renewable Energy Development • CDP 11.41 Air Quality • CDP 11.43 SEVESO III Directive • CDP 11.44 Energy Security • CDP 11.45 Electricity Networks • CDP 11.47 Renewable Energy • CDO 11.48 Renewable Energy Strategy • CDP 11.49 Renewable Offshore Energy • CDP 11.50 Power Stations and Renewable Energy • CDP 11.51 Energy Storage • CDP 12.1 Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary Integrated Development of the Shannon Estuary 	N/A
--	---	-----

	<ul style="list-style-type: none"> • CDP 12.3 Marine-Related Industry/Large-Scale Industry on the Estuary Strategic Development Locations • CDP 12.4 Strategic Development Location B – Moneypoint • CDP 12.8 Harnessing the Energy Resources of the Shannon Estuary • CDP 12.15 Building on the Shannon Estuary as an Environmental Asset Offshore Renewable Energy (ORE) Development • CDP 15.3 European Sites • CDP 15.5 Natural Heritage Areas and proposed Natural Heritage Areas • CDP 15.9 Natural Heritage and Infrastructure Schemes • CDP 15.10 Environmental Impact Assessment • CDP 15.11 Brownfield Site Regeneration and Contaminated Land • CDP 16.8 Sites, Features and Objects of Archaeological Interest <p>Specifically, CDP Objective 12.6 relates to Strategic Development Location B – Moneypoint and sets out the following:</p> <ul style="list-style-type: none"> a) To safeguard the role and function of Strategic Development Location B –Moneypoint as a key strategic driver of economic growth in the country, facilitating its sustainable growth, operational expansion and diversification, in accordance with national and regional energy objectives. b) To support the redevelopment of the Moneypoint power generation station site as a green energy hub and the development of the Shannon Estuary as a focal point for the offshore wind industry in Europe. c) To support and facilitate the development of marine related industry on lands adjacent to Moneypoint which is compatible with the primary use of the SDL as a Strategic Energy Location. d) To ensure that all proposed developments shall be in accordance with the Birds and Habitats Directive, Water Framework Directive and all other relevant EC Directives. e) To ensure that all proposed development at Strategic Development Location B shall incorporate the Mitigation Measures as contained in the Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary for ensuring the integrity of the Natura 2000 Network. <p>The lands at Moneypoint zoned for “Marine-Related Industry.” Lands zoned for such purposes “provide for marine-related industry and large-scale uses that create a synergy with the marine use. Marine related industry shall be taken to include the use of land for industry that, by its nature, requires a location adjacent to estuarine/deep water including a dependency on marine transport,</p>	
--	---	--

	transshipment, bulk cargo or where the industrial processes benefit from a location adjacent to the marine area.”	
	<p>Strategic Integrated Framework Plan (SIFP) for the Shannon Estuary</p> <p>The Clare County Development Plan 2023-2029 contains specific economic development objectives for the Marine Related Industry site at Moneypoint which seeks to harness the economic potential of the Estuary at this location and to capitalise on its natural deepwater characteristics for enhanced maritime activity as already outlined in this submission. In addition, Volume 9 contains the Strategic Integrated Framework Plan for the Shannon Estuary which is accompanied by a separate Natura Impact Statement and Strategic Environmental Assessment. The SIFP provides a strategic level of assessment in terms of future potential development. In particular, it highlights the key plan level surveys, investigations, data and mitigation measures which would be required for any such development in the estuary. Following the publication of the SIFP a significant implementation phase commenced which included the collation of key pieces of baseline information. Some of this baseline information is available through the Local Authority if deemed necessary to the individual project assessments or to the Concept level assessments. The data serves to reduce the lead in time required in terms of capturing some of this baseline information for example in relation to Bird Usage and should be explored in terms of its applicability to your investigations and assessments. Clare County Council would advise careful consultation with Volume I and associated volume of mitigation measures (Volume II) of the SIFP. Most recently the SIFP Steering Group have undertaken the preparation of a baseline noise map for the Shannon Estuary which aims to establish for the first time the baseline anthropogenic and environmental background noise which exists within this ecosystem and against which all future development can be assessment and bench marked. The outputs from this study consist of reporting and GIS datasets which are interoperable, interchangeable and can be interrogated with other datasets. Using the Quite Oceans Quonops model the output from the study consists of modelling and supply of baseline noise maps for the area which includes the Shannon Estuary and the 3 nautical mile extent from Counties Clare, Limerick and Kerry. The output includes for seasonal baseline noise maps for 125Hz Third Octave Band. In total 112 sound maps were delivered (4 seasons, 4 types of sound, 7 percentiles) The sound types included;</p> <ul style="list-style-type: none"> • Natural sound level (Natural sound level, produced by the wind) • Traffic (Sound level of the vessel traffic) • Baseline sound level (Combination of natural and traffic sound) <p>Baseline excess level (Level of traffic sound above environmental sound) The report and associated datasets is currently being finalised and will be signed off by the SIFP Steering Group in the coming weeks.</p>	<p>This submission is acknowledged. The SIFP is referred to in the NIS report but further information in relation to ongoing monitoring and available datasets have been provided.</p> <p>The availability of this data and monitoring shall be acknowledged in the SEA and the NIS reports and any reference to assessment and mitigation considered likely necessary at project stage should point to the availability of this data.</p>

	<p>Marine Area Planning</p> <p>Following the publication and enactment of the Marine Area Planning Act 2021 much of the consenting process associated with the various elements of the Green Atlantic concept will ultimately sit with the MARA and on An Coimisiún Pleanála. However, there may be elements or portions there of that fall within Part XXI of the Planning and Development Act 2000 (as amended) which will enable the planning authority to consider an application for development in the maritime area. In so far as possible it would be useful within the Concept Document to establish and set out the various marine activities e.g. dredging, energy related developments and the associated consents required under the MAP Act e.g. MAC, Maritime Licence and whether it will sit with ACP or the Coastal Planning Authority.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>Strategic Environmental Assessment</p> <p>Section 3.2.5.1 of the SEA Environmental Report outlines the SIFP as a sub-regional plan which it indicates is under review. This is not the case with respect to the SIFP nor was it re-published. It does form a separate volume of the Clare County Development Plan 2023-2029 however it wasn't separately republished, nor will it undergo review in the coming years. Given the SIFP is a non-statutory plan and further to the publication of the MAP Act which requires the preparation of sub-national maritime Plans (DMAPs) which is the statutory requirement, the SIFP will not be reviewed but will continue to provide guidance and background information with regards to future potential development within the Shannon Estuary. Once a West Coast/Shannon Estuary DMAP is prepared this will become the statutory marine Plan for the Shannon Estuary and wider West Coast area.</p>	<p>This submission is acknowledged. It is noted that the Department of Climate, Energy and the Environment are currently proceeding with a National Level Offshore Renewable Energy Designated Marine Area Plan. It is anticipated that the Green Atlantic at Moneypoint shall be referred to or referenced within said documentation. Following review, no modifications to the NIS are considered necessary.</p>

	<p>Principle Environmental Effects</p> <p>The approach as undertaken within the SEA with respect to the incorporation of Overarching Principles (OPs) into the GA Concept together with an assessment of the ‘unmitigated’ scenario for each of the GA Concepts is noted. The Local Authority would agree with this approach in terms of top down and bottom-up assessment in order to protect the environment and would deem this good practice.</p> <p>Table 8.2 is quite difficult to understand in terms of what the colour coding refers to or the level of environmental impact it reflects as there doesn’t appear to be a legend associated with this table. The assessment would benefit from an explanatory note or legend outlining the assessment categories.</p> <p>Coastal Infrastructure Zone (CIZ) – the assessment within Table 8.2 identifies the potential for the ESB to remove the existing jetty at Moneypoint and for the development of new quayside infrastructure including infilling/land reclamation and/or repurposing of the existing jetty and barge landing facility. The principles associated with this development zone predominantly reflect potential developments, alterations or changes within the transitional waters of the Shannon Estuary. There is therefore the potential for these changes to warrant consideration of IROPI in line with the requirements of Article 6 (4) of the Habitats Directive which should be flagged or set out at the Concept level. Given the publication of the Site-Specific Conservation Objectives for both the Lower River Shannon SAC and River Shannon and Fergus Estuaries SPA there should be an acknowledgment within the SEA Environmental Report taking the findings of the NIS into consideration that there may be a potential for a loss of an area of qualifying interest Annex I habitat if the development occurs within these identified areas. This is noting that the NIS clearly states “The GA Concept Coastal Infrastructure Zone is inclusive of areas which have been identified as either Annex I reef [1170] or estuaries [1130] habitat. In addition, an area of the Annex I QI habitat perennial vegetation of stony banks [1220] is present outside of, but adjacent to, the westernmost extent of the Coastal Infrastructure Zone”. A permanent loss of qualifying interest Annex I habitat in an SAC is likely to constitute an adverse effect on the integrity of the site in line with European Case Law. (See Court of Justice of the European Union ruling on the ‘Galway City Outer Bypass’ case, C-258/11.). This finding should either be reflected in the NIS, with consideration given to the potential for an Article 6(4) or IROPI case to be made for all or some of the specific projects, including details of compensation required. The Concept Document provides an opportune time to identify and set out areas or parts of the Shannon Estuary that could be considered as Compensation and to commence discussions with the Department of Housing, Local Government and Heritage around the applicability of these areas and the requirements from the Commission in regard to this. While the Local Authority fully appreciates the REPowerEU plan to accelerate the clean energy transition it does not circumvent the requirements of the Habitats Directive and the lead in time for such compensation measures to be established should not be underestimated. Ahead of the preparation of any future DMAP for the West Coast it would be prudent to undertake preliminary work in this area.</p>	<p>This submission is acknowledged and noted. In relation to the Coastal Infrastructure Zone (CIZ), the potential for adverse effects on site integrity and the need for consideration under Article 6(4) and IROPI has been acknowledged within the NIS.</p> <p>Detailed discussions and decisions on compensation will be addressed at the project level when the nature and extent of impacts are known. At this strategic stage, it would be inappropriate to recommend mitigation measures, as these would not be bespoke to project-specific design, construction, or operational details and may not align with the final proposals. The principle of early engagement with the Department is noted for future planning stages.</p> <p>No modifications to the NIS are considered necessary.</p>
--	---	---

	<p>Cumulative and in-combination effects.</p> <p>The SEA Environmental Report broadly speaks to the potential for cumulative and in-combination effects from the implementation of the GA Concept in combination with the increased development, land-use change and associated development emanating in line with any relevant LAPs/CDPs and any other plans which may affect areas in close proximity to development arising from the implementation of the GA Concept. It refers to the list of plans as outlined in Appendix A.2 however this list does not include for the Limerick or Kerry County Development Plans, or the Draft Clare County Biodiversity Action Plan 2025-2031. Please also note, the Clare County Heritage Plan is now published – Clare County Heritage Plan 2024- 2030. Of particular note is the absence of reference to the Shannon Foynes Port Company Vision 2041 Masterplan which not only sets out the vision for Foynes Port but for the entire estuary in terms of marine related industry and investment in particular around the emerging offshore renewable energy sector. The Masterplan document identified four core facilities on the Shannon Estuary to support the delivery of floating offshore wind at scale together with Wet Storage areas and the potential for cable corridors. These key infrastructural developments have the potential to act in combination with the Green Atlantic @ Moneypoint Concepts to lead to cumulative and in-combination effects on the same Qualifying Interests and Special conservation Interests of the associated European Sites through disturbance, habitat loss and fragmentation together with displacement over prolonged periods of time both as part of the construction and operational phases. It is essential that the Environmental Assessments which accompany the GA Concept document address these potential losses at an ecosystem level and establish protective Plan level Mitigation Measures which will ensure the protection of these sites at project level.</p>	<p>This submission is acknowledged and noted. The in-combination effects sections of the reports will be updated to include reference to the plans identified in the submission, including the Shannon Foynes Port Company Vision 2041 Masterplan and relevant County Development and Biodiversity Plans. Plan-level mitigation measures will be considered and developed as appropriate at the strategic stage, with detailed measures to be addressed at project level when specific design and construction details are available</p> <p>The In-Combination section of the NIS report shall be updated to include reference to these plans.</p>
--	--	--

	<p>Natura Impact Statement</p> <p>Furter to the comments made above in relation to the SEA of the GA Concept the NIS highlights the potential for the Coastal Infrastructure Zone to give rise to the loss of areas of SCI wetland habitat of the River Shannon and River Fergus Estuaries SPA. However, there is no quantification of this loss in terms of percentage of the European site or the resultant impacts on the associated species which utilise this area. In addition, there is no assessment as to the cumulative impact associated with other potential developments within the Shannon Estuary which may lead to the loss of SCI wetland habitat.</p>	<p>It is acknowledged that there could be habitat loss arising from relevant projects; however, the total extent of loss cannot be quantified at this stage as project-level details are not available. The NIS recognises that any loss of QI habitat could constitute an adverse effect on site integrity and may require consideration under Article 6(4), including compensatory measures. The scale and nature of such measures will only be determined once detailed project proposals are developed.</p> <p>At this strategic stage, it would be inappropriate to recommend mitigation measures, as these would not be bespoke to project-specific design, construction, or operational details and may not align with the final proposals. Providing mitigation measures now could result in measures that are ineffective or unsuitable for the actual impacts. While cumulative impacts are an important consideration, these will also be assessed at project level when sufficient information on other developments and their interactions becomes available. No modifications to the NIS is considered necessary at this stage.</p>
	<p>Adjacent Amenities</p> <p>The immediate environs of the Moneypoint site comprise a mix of agricultural farmland, rural dwellings, a section of the national road network, and the estuary. The proposed redevelopment of the Moneypoint site should ensure that adjacent amenities and land uses are adequately protected during both the construction and the subsequent operational phases of the development.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

	<p>Visual Amenities</p> <p>It is noted that a new onshore substation is to be located either within the existing Moneypoint Site or in close proximity to the site. It is acknowledged that for technical requirements etc, it may be required to locate this infrastructure outside of the Moneypoint site. However, please note that, where possible, it is the preference of Clare County Council, on the grounds of the protection of adjacent amenities and visual amenities, which said works be appropriately accommodated within the footprint of the Moneypoint site.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>
	<p>Clare County Council welcomes the preparation of this Draft Concept Document for the Green Atlantic @ Moneypoint project and would ask that this submission be considered as part of the preparation of the finalised report and look forward to furthering engagement in the process of its preparation.</p>	<p>This submission is acknowledged and noted; however, following review, no modifications to the NIS are considered necessary</p>

BackCover
